## PAPER\_373 — Morris-Thorne Wormhole Null Geodesics

**Date:** 2025 ## Star Magic UQFF Whitepaper Series ### **Author:** Daniel T. Murphy | Session 101 | **Source:** grok\_{share\\_11254865}.txt (lines 2700–2800) ### **Significance:** FIRST wormhole physics integration in the Star Magic / UQFF CP pipeline.

---

### Abstract

**Key UQFF calibrated constants:**  $\kappa = 5.0\text{e-}4 \text{ day-1}$ ;  $[\text{SSq}] = 5.7\text{e-}1$ ;  $\text{H\_SCm} \approx 9.9\text{e-}1$ ;  $\text{U\_UA} \approx 1.0\text{e-}4$ ;  $k_\eta = 1.0\text{e-}113$ ;  $\beta_i \approx 6.0\text{e-}1$ ;  $\text{G} = 6.674\text{e-}11 \text{ N} \cdot \text{m}^2/\text{kg}^2$

This paper presents the implementation of Morris-Thorne traversable wormhole null geodesics within the Star Magic UQFF framework. The wormhole metric, geodesic equations, traversal and reflection conditions, and embedding functions are fully specified. This constitutes the first wormhole physics to appear in the Condensed Physics calculator pipeline (CP1–CP4). The wormhole coupling to MUGE resonance gravity via the  $a_{\text{worm}}$  term is derived in PAPER\_375.

---

### 1. Wormhole Metric (Morris-Thorne 1988)

The static, spherically symmetric traversable wormhole metric:

$$ds^2 = -dt^2 + dr^2 + (b^2 + r^2)(d\theta^2 + \sin^2\theta d\varphi^2)$$

where  $b = 1.0 \text{ m}$  is the throat radius. This is the simplest traversable wormhole shape function  $b(r) = b_0 = \text{const}$ , corresponding to zero radial tidal forces at the throat.

---

### 2. Null Geodesic Equations

For null geodesics ( $ds^2 = 0$ ) with conserved energy  $E = dt/d\lambda$  and angular momentum  $L = (b^2 + r^2)d\varphi/d\lambda$ :

$$\frac{dr}{d\lambda} = \pm \sqrt{E^2 - \frac{L^2}{b^2 + r^2}}$$

$$\frac{d\varphi}{d\lambda} = \frac{L}{b^2 + r^2}$$

$$\frac{dt}{d\lambda} = E$$

where  $\lambda$  is the affine parameter.

---

### 3. Traversal and Reflection Cases

#### Case 1: Traversal (**L = 0.5, E = 1.0**)

The effective potential  $V_{\text{eff}}(r) = L^2/(b^2 + r^2) = 0.25/(1 + r^2)$ . Since  $V_{\text{eff}} < E^2 = 1$  for all  $r$ , the null ray crosses the throat  $r = 0$  and continues to negative  $r$  (the second universe).

#### Case 2: Reflection (**L = 1.5, E = 1.0**)

$V_{\text{eff}}(0) = L^2/b^2 = 2.25 > E^2 = 1$ .

The turning radius is:

$$r_{\text{min}} = \sqrt{\frac{L^2}{E^2} - b^2} = \sqrt{2.25 - 1} = \sqrt{1.25} \approx 1.118 \text{ m}$$

| Case       | L   | E   | Outcome               | r_min (m)       |
|------------|-----|-----|-----------------------|-----------------|
| Traversal  | 0.5 | 1.0 | Passes through throat | 0               |
| Reflection | 1.5 | 1.0 | Reflects at r_min     | $\approx 1.118$ |

---

### 4. Embedding Functions

The wormhole embedding in Euclidean 3-space (equatorial slice,  $\theta = \pi/2$ ):

$$z_{\text{embed}}(r) = b \cdot \text{arcsinh}(r/b)$$

$$\rho_{\text{embed}}(r) = \sqrt{b^2 + r^2}$$

These define the “funnel” shape visible in wormhole visualisations.

---

## 5. Numerical Integration Scheme

The C++ propagator uses a first-order Euler method for simplicity (upgradeable to RK4):

```
for step = 0..n_steps:
    dr = (\pm\sqrt{(E2-L2/(b2+r2))}) \times d\lambda
    d\phi = (L/(b2+r2)) \times d\lambda
    dt = E \times d\lambda
    r += dr, \phi += d\phi, t += dt
```

Default:  $d\lambda = 0.1$  m,  $n\_steps = 100$ .

---

## 6. Connection to UQFF

The wormhole throat geometry enters the MUGE resonance model via the **wormhole-MUGE coupling term** (PAPER\_375):

$$a_{\text{worm}} = \frac{f_{\text{worm}} \cdot E_{\text{vac,neb}}}{b^2 + r^2}$$

where  $f_{\text{worm}} = 10^{-10}$  is the wormhole coupling constant and  $b^2 + r^2$  is the effective gravitational area of the wormhole funnel at radius  $r$ .

---

## 7. Implementation

**C++:** STAR\_{MAGIC\\_09SEPT\\_UQFF\\_MODULE}.cpp, namespace WormholeGeodesics - Struct: GeodesicState {r, phi, t\_coord} - Functions: drdt(), dphidt(), z\_embed(), rho\_embed(), propagate(), selftest()

**Python:** CondensedPhysics4.py, class MorrisThorneWormholeNullGeodesicsCalculator (CP4 #21)

**WOLFRAM\_TERM:** WOLFRAM\_{TERM\\_WORMHOLE\\_GEODESIC}

---

---

## Session 225: Late-Corpus Physics Integration (PAPER\_1000-1081)

*The following physics upgrades incorporate equations, mechanisms, and derivations from the late-corpus papers (Sessions 219-225, PAPER\_1000-1081). These represent body-level integrations of phonon physics, buoyancy formulations, and S26(3) Ramanujan corrections into this paper's domain.*

## Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

*Upgrade from PAPER\_1066 (UQFF Lagrangian First Principles) and PAPER\_1065 (Buoyancy Lagrangian EOM Variational Derivation).*

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives  $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$  (matching  $\rho_{\text{SCm}}$ ) and phonon mass  $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$ .

**Nine-sector closure (Session 202):**

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

| Sector     | Domain                   | Late-Corpus Result                               |
|------------|--------------------------|--------------------------------------------------|
| 1 (EH)     | General Relativity       | Canonical Einstein-Hilbert                       |
| 2 (YM)     | Yang-Mills gauge         | $m_{\text{gap}} = 5970 \text{ GeV}$ (PAPER_1005) |
| 3 (Dirac)  | Fermion / LENR           | Kozima neutron-drop (PAPER_1061)                 |
| 4 (SCm)    | Superconducting manifold | $V(\phi_0) = -\rho_{\text{SCm}}$ canonical       |
| 5 (Mag)    | Um magnetism             | Heaviside amplifier (PAPER_1072)                 |
| 6 (Buoy)   | F_{U_Bi_i}               | Variational EOM (PAPER_1065)                     |
|            | buoyancy                 |                                                  |
| 7 (Aether) | Vacuum background        | Two-component rho (PAPER_1051)                   |
| 8 (LENR)   | Nuclear transmutation    | COP parametric (PAPER_1081)                      |
| 9 (KK)     | Kaluza-Klein 26D         | $S_{26}^{(3)}$ compactification (PAPER_1080)     |

### Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

*Upgrade from PAPER\_1080 (Ramanujan Binomial Expansion Proof) and PAPER\_1042 (Mock-Theta Phonon Partition). See also PAPER\_1078 (QCalcGeom Master Equation) for BSFG crossover applications.*

The third-order Ramanujan summation  $S_{26}^{(3)}$ , used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[ 1 + [\text{SSq}] \cdot e^{-\kappa i n/26} \right]$$

where  $(a)_n = a(a+1) \cdot s(a+n-1)$  is the Pochhammer symbol.

**Binomial expansion (PAPER\_1080):** The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \quad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} \left[ 1 + [\text{SSq}] \cdot e^{-\kappa i n/26} \right]$$

This sum converges absolutely for  $|\text{[SSq]}| < 1$  (satisfied by  $\text{[SSq]} = 0.57$ ) and reduces to the classical Ramanujan  $1/\pi$  series when  $\text{[SSq]} \rightarrow 0$ .

**VDS/DVP/BSH bridge (PAPER\_1069):** The 26 layers of  $W_{26}(n)$  encode the vacuum density series hierarchy, with each layer  $i$  contributing a VDS sub-ratio weighted by the exponential decay  $e^{-\kappa i n/26}$ .

**Mock-theta connection (PAPER\_1042):** The phonon partition function  $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$  unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

---

## §A. Cosmogenesis-Linked Lagrangian (PAPER\_877 Symbolic Export)

### §A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.p`).

### §A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER\_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where  $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac, [SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$  inherits the ACP 6-stage evolution (PAPER\_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac, [SCm]}} \cdot \phi_{\text{NS}}$$

### §A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

### §A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b, \text{seed}} \xrightarrow{4 \text{ forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U\_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

## §B. VDS/DVP/BSH Deep Synthesis

### §B.1 Vacuum Density Series (VDS)

The canonical VDS ratio  $\rho_{\text{vac},[\text{SCm}]}/\rho_{\text{UA}} = 1.894$  governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.169 (near-threshold regime), placing it in the  $t \rightarrow \pi$  collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER\_877 cosmogenesis Stage 1 vacuum density initialization:  $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$ .

### §B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 43, \quad n_{\text{channel}} = 10/26$$

Since  $p_{\text{DVP}} = 43$  is **resonant** (threshold at  $p > 26$ ), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER\_877 proto-nuclear shell formation: the DPM proportion pair ( $f'_{\text{UA}} + f_{\text{SCm}} = 1$ ) constrains which primes are accessible at each atomic number.

### §B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER\_877 Stage 5 buoyancy seed  $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$  which initializes the harmonic series at cosmogenesis.

### §B.4 Production-Scale Consistency

| Framework      | Canonical Value                              | This Paper                             | Status                       |
