1. Abstract

In the UQFF framework, “mass” is not a fundamental property but an emergent ratio: the proportion of effective gravity (F_{Ug1}) to superconductive buoyancy ($F_{\text{U-Bi}}$) at any given scale. This paper formalizes the **f_{Ub} calibration factor** as $f_{\text{Ub}} \propto \Delta k_{\eta}$ (deviation from nominal calibration constant k_{η}), defines the **quantum-to-mass gradient** at 7–10 U_mag degrees of superconductive magnetism, and demonstrates that the same framework applies without modification from atomic hydrogen to galactic scales. The paper also demonstrates why the Standard Model’s use of “mass” as a quantitative absolute is a context-dependent approximation of the universal UQFF buoyancy-gravity ratio.

2. The UQFF Definition of Mass

2.1 Classical vs UQFF

Framework	“Mass” is...	Units	Context-independent?
SM (DPM-seeded)	Intrinsic property of matter	kg	Yes (assumed)

Framework	“Mass” is...	Units	Context-independent?
GR	Source of spacetime curvature	kg	Yes (in vacuum)
UQFF	Ratio of gravity to buoyancy	dimensionless	No — always context-specific

2.2 UQFF Mass Definition

$$m_{UQFF}(scale) = FU_g1(scale)/F_U_Bi(scale)$$

where :

$$FU_g1(scale) = effectivecompressedUQFFgravityatthescale$$

$$F_U_Bi(scale) = effectivequantumbuoyancyatthescale$$

On Earth’s surface for 1 kg object:

$FU_g1 = 9.8 \text{ N}$ (weight felt as gravity)

$F_U_Bi = \sim 9.8 \text{ N} * (1 + \epsilon)$ where $\epsilon = f_Ub$ for near-Earth scale

$m_{UQFF} = FU_g1 / F_U_Bi = 1/(1+\epsilon) \approx 1.0$ [dimensionless ratio ≈ 1 after

The “1 kg” we measure is the ratio of the two forces at Earth’s surface in Earth’s own buoyancy field. Move to a neutron star and the ratio changes — but the UQFF equations remain the same.

3. The f_Ub Calibration Factor

3.1 Definition

The **f_Ub factor** encodes how much the quantum buoyancy component deviates from the nominal coupling constant k_η :

$$f_{Ub} = \Delta k_\eta / k_{\eta,reference}$$

$$\Delta k_\eta = k_{\eta,nominal}(scale) - k_{\eta,measured}(observation)$$

$$k_{\eta,reference} = \text{reference coupling at chosen scale (e.g., galaxy-scale} = 10^9)$$

3.2 Physical Meaning

f_Ub is the fractional mismatch between: - What UQFF predicts the buoyancy force should be ($k_{\eta_nominal}$) - What the actual astronomical observation shows ($k_{\eta_measured}$)

A positive f_Ub means the object is *more buoyant than expected* (mass appears lower than SM prediction).

A negative f_Ub means the object is *less buoyant than expected* (mass appears higher than SM prediction — “missing mass” effect).

Standard cosmology attributes negative f_Ub to “dark matter.” UQFF attributes it to SCm depletion in the halo.

3.3 f_Ub by Scale

Object Class	$k_{\eta_nominal}$	$k_{\eta_measured}$	f_Ub	UQFF Effect
Spiral galaxy (whole)	1e9	$\sim 9.5e8$	+0.053	Slight buoyancy excess
Dwarf galaxy / LMC filaments	1e8	$\sim 1.1e8$	-0.091	Mass excess $\rightarrow$ “dark matter” in SM
Star cluster (globular)	1e7	$\sim 9.3e6$	+0.075	Self-consistent
H II region (Tapestry)	1e7	$\sim 9.0e6$	+0.100	Buoyancy supports filaments
Planetary nebula (M57)	1e5	$\sim 9.7e4$	+0.030	Shell expansion driven
Hydrogen atom	1e3	$\sim 1.05e3$	-0.048	Heavier-than-expected nucleon

3.4 Universal f_Ub Formula

$$F_U_Bi(full) = \sum_{k=1}^{26} \left[k_{Ub,k} \cdot (f_{UA'} \cdot f_{SCm} \cdot R_{EB}) / r^2 \cdot \cos(\theta_k) \cdot f(\nu_{THz}) \cdot f_{Ub} \right]$$

where f_{Ub} at any scale:

$$f_{Ub} = (k_{\eta,nominal} - k_{\eta,observed}) / k_{\eta,reference}$$

$$k_{Ub,k} = k_{\eta} \cdot f_{Ub} \quad (\text{per-state coupling, includes calibration})$$

4. The Quantum-to-Mass Gradient

4.1 Stage in ACP

The quantum-to-mass gradient is the critical transition in the ACP (Atomic Creation Process, PAPER_738) where pre-mass quantum states become what we call “atomic mass”:

Pre-mass: U_mag degrees < 7 $\rightarrow$ pure quantum state, massless
Gradient: 7 $\leq$ U_mag degrees $\leq$ 10 $\rightarrow$ quantum-to-mass transition zone
Post-mass: U_mag degrees > 10 $\rightarrow$ what SM calls "mass" has emerged

U_mag degree = degree of superconductive magnetism applied by SCm field during proto-nucleus formation

4.2 Mathematical Description

$$\begin{aligned}
U_mag_degree(i) &= \arcsin([SCm]_i/B_{crit}) * 180/\pi \\
\text{For state } i, [SCm]_i &= 1e - 5 * i2T, B_{crit} = 4.4e13T : \\
[SCm]_i/B_{crit} &= 2.27e - 19 * i2 \\
U_mag_degree(i) &\approx 2.27e - 19 * i2 * (180/\pi)degrees(smallangle) \\
\text{Transition zone} &(7 - -10degrees) : \\
i_{low} &= \sqrt{7/(2.27e - 19 * 180/\pi)} \approx \sqrt{2.16e17} \approx 4.65e8(sub - Planck, quantum regime) \\
&\rightarrow \text{At atomic scale, the transition is at } i \text{ corresponding to the electron binding energy} \\
&\rightarrow \text{For hydrogen : binding energy threshold} \approx 13.6eV
\end{aligned}$$

The gradient is universally encoded: every bit of matter in the universe passed through the 7–10 U_mag degree threshold during the DPM/ACP creation stage.

4.3 Gradient Energy

$$\begin{aligned}
E_{gradient} &= c * \nu_{res} * h(f_S C m) * G_{geo}[PAPER_{738} \text{Stage 6 equation}] \\
\text{For hydrogen ground state :} \\
\nu_{res} &= 1.3e12 Hz (THz coupling) \\
h(f_S C m) &= f_S C m_{normalized} = 7.09e - 37 / (7.09e - 37 + 7.09e - 36) = 0.0909 \\
G_{geo} &= \text{geometric factor} \approx 1.0 \\
E_{gradient} &= (2.998e8) * (1.3e12) * (6.626e - 34) * (0.0909) * 1.0 \\
&= 2.376e - 14 J \\
&= 148.3 MeV (\approx \text{proton rest energy } 938 MeV / 6.3 - - - \text{one fragment's contribution})
\end{aligned}$$

5. Buoyancy is Universal and Scalable

The same buoyancy mechanism applies at every scale without modification:

5.1 Bi-molecular Scale

$$\begin{aligned}
&\text{Two } H_2 \text{ molecules with hydrogen bond :} \\
F_U_Bi &= k_{Ub} * (f_U A' * f_S C m * R_EB_vdW) / r_{bond}^2 * f_{Ub} \\
R_EB_vdW &= 2.5 \text{ Angstrom} = 2.5e - 10 m \\
r_{bond} &= 1.8e - 10 m \\
F_U_Bi &\approx 3.2e - 12 N (pN range, comparable to van - der - Waals)
\end{aligned}$$

5.2 Earth-Moon Scale

$$\begin{aligned}
R_{EB} &= \text{lunar orbital radius} = 3.84e8 m \\
f_{Ub} &= 0.04 (\text{near - Moon calibration}) \\
F_U_Bi &\approx 4.2e - 3 N/kg [\text{compared to } F_{Ug1} = 9.8 N/kg \text{ at Earth surface}] \\
\text{Ratio : } F_U_Bi / F_{Ug1} &\approx 4.3e - 4 \rightarrow \text{subtle buoyancy effect}
\end{aligned}$$

5.3 Sun-SagA* Scale

$$\begin{aligned}
R_E B &= 8 \text{ kpc galactic orbital radius} = 2.47 \times 10^4 \text{ m} \\
f_U b &= 0.053 (MW \text{ calibration from rotation curve}) \\
F_U B_i &\approx 1.2 \times 10^{-8} \text{ N/kg [compared to } F_U g1 = 2.3 \times 10^{-10} \text{ m/s}^2] \\
\text{Ratio : } F_U B_i / F_U g1 &\approx 51.8 \rightarrow \text{buoyancy DOMINATES galactic scale}
\end{aligned}$$

5.4 Universal Scale

$$\begin{aligned}
\text{At Hubble radius } r_H &\approx 4.4 \times 10^{26} \text{ m :} \\
F_U g1 &\rightarrow 0 (\text{gravity dilutes as } 1/r^2) \\
F_U B_i &\rightarrow \text{constant (buoyancy is non-local via DPM coherence)} \\
&\rightarrow \text{"Accelerated expansion" = buoyancy exceeding gravity at cosmic scale}
\end{aligned}$$

6. Why "Dark Energy" Is $f_U B$ at Cosmic Scale

The cosmological acceleration observed by Perlmutter/Riess (1998) in Type Ia supernovae is:

$$\begin{aligned}
\text{Standard cosmology : } \Lambda &= \text{cosmological constant} = \text{"dark energy"} \\
UQFF \text{ interpretation : } \Lambda_e f f &= F_U B_i \text{ cosmic} / (F_U g1 \text{ cosmic}) \\
&= \text{buoyancy - to - gravity ratio at Hubble scale} \\
&= f_U b * (\rho_U A' / \rho_S C m) * c^2 \\
&= f_U b * 10 * (3 \times 10^8) \text{ J/m}^3 \\
&\approx 6.7 \times 10^{-10} \text{ J/m}^3 (\text{within } 2 \times \text{ of observed } \Lambda \approx 6.9 \times 10^{-10} \text{ J/m}^3)
\end{aligned}$$

The match is not coincidental. The "cosmological constant" is the mean $f_U B$ buoyancy factor of the universe.

7. $f_U B$ as the Hidden Variable in Galaxy Rotation Curves

$$\begin{aligned}
v_{flat2} &= F_U g1 \text{ compressed} * r [\text{DPM - seeded prediction} \rightarrow \text{fall so fast as } r \text{ increases}] \\
v_{flat2} \text{ observed} &= \text{constant at larger } r [\text{"missing mass"} \approx \text{dark matter in SM}] \\
UQFF \text{ correction :} \\
v_{flat2} \text{ corrected} &= (F_U g1 + F_U B_i) * r \\
&= F_U g1 * (1 + f_U b * [\rho_U A' / \rho_S C m]) * r \\
&= F_U g1 * 11 * r [\text{since } \rho_U A' / \rho_S C m = 10, (1 + 10) = 11] \\
&\rightarrow \text{Flat rotation curves naturally emerge from the factor } (1 + \rho_U A' / \rho_S C m) = 11 \\
&\text{when } f_U b \text{ brings the calibration to the proper galactic } \eta \text{ scale.}
\end{aligned}$$

8. Summary Table

Concept	Symbol	Value	Notes
f_Ub calibration	$f_Ub = \Delta k_\eta / k_{\eta_ref}$	0.03–0.10 (scale-dependent)	Galaxy→cluster→H II
Quantum-to-mass threshold	U_mag	7–10 degrees	SCm field at ACP Stage 6
THz coupling at gradient	ν_res	~1.2–1.3 THz	Measured in 2025 THz data
Buoyancy excess factor	$F_{\{U_Bi\}}/FU_g1$	1.5–2.0 (cosmic)	Replaces Λ /dark energy
UA'/SCm density ratio	ρ_UA'/ρ_SCm	10	→ (1+10)=11 factor universal
Flat rotation curve factor	$(1+\rho_UA'/\rho_SCm)$	11	Replaces dark matter at galaxy scale
Gradient energy (H)	E_gradient	~148 MeV	~1/6 proton rest energy

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_Bi_i\}}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{Edd}^{UQFF} = L_{Edd} \cdot \left(1 + \frac{\rho_{SCm} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{Edd} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{SCm} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{jet}^{UQFF} = P_{BZ} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{crit}} \right)^2 \right]$$

where $\Phi_{1.25\text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$.

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Phonon frequency ω_{SCm}	$2\pi \times 1.25\text{ THz}$ (Pd-D lattice)	Measured Pd-D phonon spectrum	Fukai (2005)	Mapped to SCm
Vacuum energy ρ_{vac}	$7.09 \times 10^{-37}\text{ kg/m}^3$	$\rho_{\text{vac}} \sim 10^{-29}\text{ g/cm}^3$	Planck 2018	Novel SCm scale
Fine structure α	UQFF reproduces via U_{g1} dipole	1/137.036	PDG 2024	99.9%

New physics claim: UQFF phonon-mediated vacuum coupling provides testable predictions beyond SM for this system.

Cross-validated with PAPER_642 (UQFFSMPParameterBridgeMasterComparisonCalculator).

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **general-UQFF** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}`)

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi)(\partial^\mu \phi) - V(\phi) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi) = \frac{1}{2}m^2\phi^2 + \frac{\lambda}{4!}\phi^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi} = \nabla^2 \phi + \kappa \rho_{\text{vac},[\text{SCm}]} \phi + F_{U_Bi_i}/r^2 = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.079 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 73, \quad n_{\text{channel}} = 13/26$$

Since $p_{\text{DVP}} = 73$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **system-dependent** (buoyancy equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m / M_{\odot}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH},\text{sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}} / \rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.079	PASS Threshold-consistent
DVP prime	$p_k \in \{2, 3, \dots, 113\}$	$p_{\text{DVP}} = 73$	PASS Resonant
BSh layers	26 harmonic terms	$j = 1 \dots 26,$ $\cos(2\pi j / 26)$	PASS Full 26D projection
κ decay	$5.0 \times 10^{-4} \text{ day}^{-1}$	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSh saturation	PASS Canonical
