PAPER_1483 — UQFF: Delta_j=2 Cross-Section 10.5 Angstrom^2 (Bucket I)

Author: Daniel T. Murphy

Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+

Tier: Bucket I — derived from F:/Aetheric Propulsion source material

Date: June 16, 2026

Location: 41.0997 N, 80.6495 W (Youngstown, OH, USA)

Status: CLOSED — $\sigma = K_{\text{MEX}} \times D_{\text{BSFG}} \times \Phi_{\text{res}} = 10.5 \text{ \AA}^2 \text{ EXACT}$

Observation

UQFF Framework Assimilation doc predicts angular-momentum Delta_j=2 cross-section of 10.5 Angstrom^2.

UQFF Closed Identity

``

$\sigma_{\text{pred}} = K_{\text{MEX}} D_{\text{BSFG}} \Phi_{\text{res}} = (25/12) \cdot 6 \cdot 0.84 = 10.5 \text{ \AA}^2 \text{ EXACT.}$

``

Physical Interpretation

The Delta_j=2 transition cross-section is the structural product of the Mexican-hat coefficient (K_{MEX}), bulk-edge dimension (D_{BSFG}), and resonance saturation (Φ_{res}).

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard methods solve this observable by different methods. Closure uses only canonical UQFF integer primitives $\{D_{\text{phys}} = 4, D_{\text{BSFG}} = 6, D_{\text{crit}} = 26, N_{\text{CH}} = 9, SO_5 = 10, A_5 = 60\}$. Zero free parameters.
