Abstract

This paper presents a UQFF analysis of SCm Density Planetary Scaling Law: $\rho_{\text{SCm}} \propto M^{\alpha}$, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

1. Overview

PAPER_405 establishes the **first systematic SCm density (ρ_{SCm}) planetary scaling law** extracted directly from the construction file C++ body initialization.

Four solar system bodies are assigned explicit SCm densities spanning 4 orders of magnitude, revealing a log-linear power law dependent on body mass. This scaling law is a fundamental UQFF parameter governing E_{react} , magnetic contribution, and SCm-augmented dipole moment.

2. SCm Density Canonical Values

Body	Mass (kg)	ρ_{SCm} (arb. units)	$\log_{10}(M)$	$\log_{10}(\rho_{\text{SCm}})$
Sun	1.989×10^{30}	10^{15}	30.30	15.00
Jupiter	1.898×10^{27}	10^{13}	27.28	13.00
Earth	5.972×10^{24}	10^{12}	24.78	12.00
Neptune	1.024×10^{26}	10^{11}	26.01	11.00

3. Power Law Derivation

3.1 Sun to Jupiter Scaling

$$\frac{\rho_{\text{SCm,Sun}}}{\rho_{\text{SCm,Jup}}} = \frac{10^{15}}{10^{13}} = 10^2$$

$$\frac{M_{\text{Sun}}}{M_{\text{Jup}}} = \frac{1.989 \times 10^{30}}{1.898 \times 10^{27}} = 1047.9$$

$$\text{Power law exponent: } \alpha = \frac{\Delta \log \rho}{\Delta \log M} = \frac{2}{3.02} \approx 0.66$$

3.2 Jupiter to Earth Scaling

$$\frac{\rho_{\text{SCm,Jup}}}{\rho_{\text{SCm,Earth}}} = \frac{10^{13}}{10^{12}} = 10$$

$$\frac{M_{\text{Jup}}}{M_{\text{Earth}}} = \frac{1.898 \times 10^{27}}{5.972 \times 10^{24}} = 317.8$$

$$\text{Power law exponent: } \alpha = \frac{1}{2.50} \approx 0.40$$

3.3 Neptune Anomaly

Neptune ($M = 1.024 \times 10^{26}$ kg) has $\rho_{\text{SCm}} = 10^{11}$ — **2 orders below Jupiter** despite being only 1.85 orders lighter. This suppression is consistent with Neptune's ice-giant composition: water-ice and methane mantles reduce SCm coupling efficiency compared to gas giants (Jupiter: $\sim 93\%$ H/He).

3.4 Best-Fit Power Law (Sun + Jupiter + Earth)

$$\log_{10}(\rho_{\text{SCm}}) = 0.57 \cdot \log_{10}(M) - 2.3$$

$$\boxed{\rho_{\text{SCm}} \propto M^{0.57}}$$

Interestingly, the slope 0.57 equals the calibrated **[SSq] = 0.57** (PAPER_383), suggesting deep structural coherence between the SCm density scaling exponent and the UQFF calibration constant.

4. Novel Physics

4.1 SCm Density as a New Planetary Property

Traditional planetary physics describes bodies via M , R , T_{eff} , B , and composition. PAPER_405 introduces ρ_{SCm} as a **new intrinsic planetary property** — the Superconductive Magnetic density field associated with each body.

4.2 Scaling Exponent $\approx$ [SSq] = 0.57

The remarkable alignment of $\alpha \approx$ [SSq] = 0.57 suggests:

$$\rho_{\text{SCm}}(M) = \rho_0 \cdot \left(\frac{M}{M_0} \right)^{[\text{SSq}]}$$

with $\rho_0 = \rho_{\text{SCm,Sun}} = 10^{15}$ arb.units. This would be the **first dynamic application of [SSq]** — as a physical power-law exponent for SCm density vs body mass under UQFF.

4.3 Neptune Ice-Giant Suppression

The Neptune deviation from the Sun-Jupiter-Earth power law (below by ~ 0.5 dex in ρ_{SCm}) provides a **compositionally-sensitive UQFF parameter**:

Planet Type	SCm Coupling	ρ_{SCm} Behavior
Gas giant ($\geq 90\%$ H/He)	Strong	Follows $M^{0.57}$ law
Ice giant (H ₂ O/CH ₄ /NH ₃ dominant)	Suppressed	Below power law by ~ 0.5 dex
Rocky planet (silicate core)	Intermediate	Approximately on the trend

5. Application to E_{react}

The E_{react} formula (PAPER_393):

$$E_{\text{react}} = \frac{\rho_{\text{SCm}}}{\rho_A} \cdot v_{\text{SCm}}^2 \cdot \exp(-\kappa t)$$

With ρ_{SCm} now body-specific:

Body	ρ_{SCm}	$E_{\text{react}}(t=0)$ (J/m ³)
Sun	10^{15}	8.808×10^{54}
Jupiter	10^{13}	8.808×10^{52}
Earth	10^{12}	8.808×10^{51}
Neptune	10^{11}	8.808×10^{50}

The 4-order span of E_{react} across solar system bodies follows directly from the SCm density scaling law established here.

6. C++ Source

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
 > (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi}}$ jet
 > modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{\rho_{\text{H}}} \cdot V \cdot S_{26}^{(3),2} \cdot \left(\frac{G M}{r_H^2}\right)\right)$$

where:

- $L_{\text{Edd}} = 4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left(1 + \beta_i \cdot \Phi_{1.25, \text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right)$$

where $\Phi_{1.25, \text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M - σ correction (PAPER_1048): The phonon-corrected M - σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2} (\partial_\mu \phi_{\text{NS}}) (\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac, [SCm]}} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\lgamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{NS}}) = \frac{1}{2} m^2 \phi_{\mathrm{NS}}^2 + \frac{\lambda}{4!} \phi_{\mathrm{NS}}^4 + \kappa \cdot \rho_{\mathrm{vac, [SCm]}} \cdot \phi_{\mathrm{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{NS}}}} = \nabla^2 \phi_{\mathrm{NS}} - (4\pi G \rho_{\mathrm{NS}}/c^2) \phi_{\mathrm{NS}} + \Omega_{\mathrm{spin}} \partial_t \phi_{\mathrm{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \rightarrow \text{DPM + ACP} \rightarrow \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \text{Stage 5} \rightarrow U_{\mathrm{b, seed}} \rightarrow \text{4 forces} \rightarrow F_{U_{\mathrm{Bi}_i}} \rightarrow \text{sector E-L} \rightarrow \frac{\delta S}{\delta \phi_{\mathrm{NS}}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac, [SCm]}} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac, [SCm]}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.074 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 53, \quad n_{\mathrm{channel}} = 16/26$$

Since $p_{\mathrm{DVP}} = 53$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}}' + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]} \cdot \frac{m}{M_{\mathrm{odot}}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - \tau_{\mathrm{BSH}}}{\tau_{\mathrm{sat}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.
