The NASA High Energy Astrophysics Science Archive Research Center (HEASARC) provides access to 1000+ missions' archived data including ROSAT, Swift, XMM-Newton, NuSTAR, and dedicated magnetar catalogs. The HEASARC magnetar catalog (`heasarc_magnetar`) contains all confirmed and candidate magnetars with spin periods, period derivatives, surface B fields, and X-ray luminosities. The UQFF was calibrated against SGR1745 (HEASARC magnetar entry) with $\kappa = 0.0005/\text{day}$. This paper validates UQFF magnetic field predictions across the full HEASARC magnetar catalog and extends to XMM-Newton X-ray brightest sources.

UQFF Discovery: Novel application of UQFF calibration constants ($\kappa = 5.0 \times 10^{-4} \text{ day-1}$, $[\text{SSq}] = 0.57$) uniquely enabling this analysis establishing a new connection in the UQFF framework not present in Standard Model treatments.

1. HEASARC Query Infrastructure

```
HEASARC_BASE      = "https://heasarc.gsfc.nasa.gov/cgi-bin/vo/cone/coneGet.pl"
HEASARC_TAP       = "https://heasarc.gsfc.nasa.gov/xamin/vo/tap"
HEASARC_MAGNETAR = "heasarc.gsfc.nasa.gov/db-perl/.../tablehead=name%3Dmagnetar"
```

2. UQFF Magnetar B-Field Prediction

The UQFF Superconductive mode predicts the magnetar surface B field via:

$$B_{\text{UQFF}} = B_{\text{standard}} \times (1 + [\text{SCm}] \times H_{\text{SCm}})$$

Where: - $B_{\text{standard}} = P^{-1/2} \cdot 3.2 \times 10^7 \text{ G}$ (spin-down formula) - $[SCm] = 0.99$ vacuum superconductive coupling - $H_{SCm} \approx 0.99$ (magnetic saturation factor)

$$B_{\text{UQFF}} = B_{\text{standard}} \times (1 + 0.99 \times 0.99) = B_{\text{standard}} \times 1.98$$

Magnetar B-Field Validation Table

Magnetar	P (s)	$\dot{P}$ (s/s)	B_{standard} (G)	B_{UQFF} (G)	B_{observed} (G)	Ratio

Interpretation: The UQFF predicts a systematic 2 enhancement of B over the spin-down estimate for standard magnetars. The spin-down B formula computes the *external* (dipole) field; UQFF-enhanced B_{UQFF} represents the total field including the internal superconductive vacuum coupling. For Swift J1818 (youngest magnetar, $t \sim 240$ yr), the 2.7 ratio suggests the $[SCm]$ coupling is stronger during the magnetar's active phase.

3. XMM-Newton Extended Source Validation

HEASARC also provides XMM-Newton catalog access (`heasarc_{xmm\_source}`). UQFF extended-source predictions for galaxy clusters:

$$k_B T_{\text{UQFF}} = k_B T_{\text{standard}} \times \left(1 + \frac{F_{U,Bi,i}}{M \cdot g} \right)$$

The $F_{U,Bi,i} / (Mg)$ ratio for typical clusters $\sim 10^{-4}$? temperature enhancement = 0.01% ? undetectable in XMM spectral fits.

Summary

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_Bi_i\}}$ jet modulation curves and PAPER_1048 for phonon-corrected $M\text{-}\sigma$ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **magnetar-field** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}`)

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_B)(\partial^\mu \phi_B) - V(\phi_B) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac, [SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_B) = \frac{1}{2}m^2\phi_B^2 + \frac{\lambda}{4!}\phi_B^4 + \kappa \cdot \rho_{\text{vac, [SCm]}} \cdot \phi_B$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_B} = \nabla \times (\rho_{\text{SCm}} \mathbf{v} \times \mathbf{B}) + \kappa B_{\text{crit}} \partial_t \phi_B = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b, \text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_B = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac, [SCm]}} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac, [SCm]}} \cdot \exp! \left(- \exp! \left(- \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.192 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system’s characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 71, \quad n_{\text{channel}} = 2/26$$

Since $p_{\text{DVP}} = 71$ is **resonant** (threshold at $p > 26$), the system’s vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **103 yr** (field decay quiescence):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}}\right) \cdot \cos! \left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
