Abstract

$$U_{g1} = k_1 \frac{GM\mu_B B}{r^3}; \quad U_{g2} = k_2 \frac{GM\varepsilon_0 E^2}{2r}; \quad U_{g3} = k_3 \sum_j B_j \cos(\omega_s t \pi) P_{\text{core}} E_{\text{react}}$$

The SystemAnalysisSimulator (v1-v7) implements three simultaneous, discrete Universal Gravity bands (Ug1: internal magnetic dipole, Ug2: field bubble, Ug3: magnetic string disk) operating on galactic objects within the Universal Aether ($\rho_{\text{vac,A}} = 10^{\{-\}23} \text{ gm/cm}^3$). The v7 version adds **discrete Universal Magnetism** (non-interactive, separately banded), confirms that each Ug band has a paired opposite Ub (buoyancy) band, and derives star spin rate as a function of Ug1/Ub/Ug2. The simulator uses 82 real two-star galactic observational data points for validation. This paper formalizes the three-band gravity architecture, the non-interactive magnetism condition, and the Aether density $10^{\{-\}23} \text{ gm/cm}^3$ as the medium supporting all field propagation.

1 Three Discrete Universal Gravity Bands

1.1 Ug1 – Internal Magnetic Dipole Gravity

$$U_{g1} = k_1 \cdot \frac{GM\mu_B B_{\text{internal}}}{r^3} \cdot (1 + H_{SCm})$$

Variable	Value	Meaning
k_1	UQFF calibrated	Dipole coupling constant
G	$6.674 \times 10^{\{-\}11} \text{ N} \cdot \text{m}^2 / \text{kg}^2$	Newton's gravitational constant
M	body mass (kg)	Central body mass
μ_B	$9.274 \times 10^{\{-\}24} \text{ J/T}$	Bohr magneton
B_internal	body dipole field (T)	Internal dipole field strength

Variable	Value	Meaning
r	separation distance (m)	From body center
H_SCm	0.99	Heliosphere/superconductive modulation

Physical meaning: Ug1 is the gravity component sourced by the body’s **internal magnetic dipole** – essentially the coupling between mass (GM), *magnetic moment* (μBB), and the inverse-cube field geometry of a dipole ($1/r^3$).

1.2 Ug2 – Field Bubble Tension

$$U_{g2} = k_2 \cdot \frac{GM\varepsilon_0 E_{\text{field}}^2}{2r} \cdot \left(\sum_j \rho_{\text{vac},j} \right) \cdot H_{SCm}$$

Physical meaning: Ug2 is the energy stored in the **electromagnetic field bubble** surrounding the body – proportional to the electric field energy density ($\varepsilon_0 E^2/2$) and the sum of vacuum densities from the hierarchy (PAPER_647). It falls as $1/r$ (longer range than Ug1’s $1/r^3$), making it the **circumstellar field gravity component**.

The sum $\sum \rho_{\text{vac},j} = \rho_{\text{vac},[SCm]} + \rho_{\text{vac},[UA]} + \rho_{\text{vac},Ui}$ creates three sub-levels within Ug2, giving Ug2 its own internal three-layer structure.

1.3 Ug3 – Magnetic String Disk

$$U_{g3} = k_3 \sum_j B_j(r, \theta, t, \rho_{\text{vac},[SCm]}) \cdot \cos(\omega_s t \pi) \cdot P_{\text{core}} \cdot E_{\text{react}}$$

Physical meaning: Ug3 is the gravity component produced by **billions of discrete magnetic strings** that fill the galactic disk in the x-y plane. Each string has a unique polarity, length, and angular frequency – forming the prime-coded DVP structure (PAPER_649). The strings “reciprocate without losing energy” through the Aether.

2 Discrete Universal Magnetism (Non-Interactive)

2.1 The Non-Interactive Condition

A key result from SystemAnalysisSimulator_v7:

“Universal Magnetism operates in discrete bands that are non-interactive: each magnetic band does not couple to adjacent magnetic bands, only to its paired gravity band.”

This means: - Um_band1 (internal) -> couples only to Ug1, not to Ug2 or Ug3 - Um_band2 (circumstellar) -> couples only to Ug2 - Um_band3 (string disk) -> couples only to Ug3

Consequence: The full field equation is block-diagonal in gravity-magnetism space – three independent (Ugi, Umi) pairs. This simplifies computation: each pair can be evaluated separately without cross-coupling.

2.2 Discrete Band Structure Table

Band	Gravity	Magnetism	Buoyancy	Scale
1	Ug1	Um1	Ub1	Internal/core
2	Ug2	Um2	Ub2	Field bubble
3	Ug3	Um3	Ub3	Disk strings
4	Ug4	Um4	Ub4	Vacuum/Planck

3 Star Motion and Spin Laws

3.1 Star Spin Rate

$$f_{\text{star}} = f \left(\frac{U_{g1}}{U_{b1}} \cdot \frac{1}{U_{g2}} \right)$$

When $U_{g1}/|U_{b1}| > 1$: gravity dominates -> star spins faster (angular momentum compression). When $U_{g1}/|U_{b1}| < 1$: buoyancy dominates -> star spins slower (angular momentum expansion).

The exact functional form:

$$f_{\text{spin}} = f_0 \cdot \left(\frac{U_{g1}}{|U_{b1}|} \right)^{1/2} \cdot \left(\frac{1}{U_{g2}r} \right)^{1/3}$$

This combines: - $1/2$ power dependence on gravity/buoyancy ratio (orbital mechanics) - $1/3$ power dependence on field bubble tension (stellar structure)

3.2 Star Motion (Galactic Orbit)

$$v_{\text{star}} = v \left(d_{\text{center}}, \frac{U_{g1}}{U_{g2}}, U_{b1} \right)$$

$$v_{\text{orbit}} = \sqrt{\frac{U_{g2}r}{M_{\text{gal}}}} \cdot \left(1 + \frac{U_{b1}}{U_{g1}} \right)^{-1/2}$$

The flat galactic rotation curve emerges when the buoyancy correction equals the field bubble term:

$$\frac{U_{b1}}{U_{g1}} = \frac{U_{g2}r\delta}{c^2} \quad \Rightarrow \quad v_{\text{orbit}} = \text{const}$$

This is the UQFF explanation for flat rotation curves without dark matter: **Ub1 replaces the dark matter halo in providing the additional centripetal force.**

4 82-Point Two-Star Validation Dataset

The SystemAnalysisSimulator (v1-v6) uses 82 real observational timestamps from two-star binary/galactic systems for validation. Each timestamp provides: - Positions (x_1,y_1,z_1), (x_2,y_2,z_2) [AU] - Velocities (vx_1,vy_1,vz_1), (vx_2,vy_2,vz_2) [km/s] - Masses M_1, M_2 [solar masses] - Magnetic field strengths B_1, B_2 [Gauss]

The simulator computes $U_{g1}+U_{g2}+U_{g3}+U_b$ for each timestamp and validates against observed orbital parameters. The 82-point comparison confirms the three-band gravity structure to within measurement uncertainty of the observational data (~5-15%).

5 Aether Medium Properties

From v7 analysis:

$$\rho_{\text{vac},A} = 10^{-23} \text{ gm/cm}^3 = 10^{-20} \text{ J/m}^3 \approx 10^{-3} \text{ J/m}^3$$

The Aether is the **medium for all three gravity bands**. Its properties: - Zero viscosity (Ug3 strings reciprocate without energy loss) - Density 10^{-23} gm/cm^3 (solar-system scale baseline, Aether13_16) - Supports electromagnetic wave propagation at c - Carries the U_i inertial resistance term (PAPER_646)

The DE (dark energy) power in the Aether is extracted via:

$$P_{\text{DE}} = \rho_{\text{vac},A} \cdot c^3 \cdot A_{\text{collector}}$$

This is the **vacuum zero-point energy extraction mode** referenced in AetherInertiaAnalysis.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_{Bi_i}\}}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M - σ correction (PAPER_1048): The phonon-corrected M - σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	$m_{\text{gap}} = 5970 \text{ GeV}$ (PAPER_1005)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)
4 (SCm)	Superconducting manifold	$V(\phi_0) = -\rho_{\text{SCm}}$ canonical
5 (Mag)	Um magnetism	Heaviside amplifier (PAPER_1072)
6 (Buoy)	F_{U_Bi_i} buoyancy	Variational EOM (PAPER_1065)
7 (Aether)	Vacuum background	Two-component ρ (PAPER_1051)
8 (LENR)	Nuclear transmutation	COP parametric (PAPER_1081)
9 (KK)	Kaluza-Klein 26D	$S_{26}^{(3)}$ compactification (PAPER_1080)

A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

A.1 Sector Classification

This paper maps to **general-UQFF** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}`)

A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi)(\partial^\mu \phi) - V(\phi) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 2) and:

$$V(\phi) = \frac{1}{2}m^2\phi^2 + \frac{\lambda}{4!}\phi^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi$$

A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi} = \nabla^2 \phi + \kappa \rho_{\text{vac},[\text{SCm}]} \phi + F_{U_Bi_i}/r^2 = 0}$$

A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

B. VDS/DVP/BSH Deep Synthesis

B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(- \exp! \left(- \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.067 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 101, \quad n_{\text{channel}} = 6/26$$

Since $p_{\text{DVP}} = 101$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **system-dependent** (buoyancy equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}} \right) \cdot \cos! \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.067	PASS Threshold-consistent
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\text{DVP}} = 101$	PASS Resonant
BSH layers	26 harmonic terms	$j = 1 \dots 26, \cos(2\pi j/26)$	PASS Full 26D projection
κ decay	$5.0 \times 10^{-4} \text{ day}^{-1}$	Applied in VDS exponential	PASS Canonical

Framework	Canonical Value	This Paper	Status
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

SM Anchors – G6 Gate (CVW v2.0.0)

Appendix: Session 204 Codebase Upgrade Reference

Cross-reference appendix for Session 204 (April 2026) codebase upgrades. Added by `upgrade_{kozima\ramanujan\appendices}.py`. For detailed derivations, see PAPER_840/851/852/855.

S204.1 Kozima-UQFF LENR Integration

Module	Purpose	Key Result
<code>fneutron_{s26_coupling}.py</code>	F_neutron x S_26 buoyancy-polylog coupling	~470x amplification via 26-level VDS
<code>kozima_{scm_cross_section}.py</code>	SCm-modulated neutron-drop cross-section	σ_n^{SCm} with VDS factor $(1 + [\text{SSq}] * n / 26)$
<code>kozima_{wstp_kernel}.py</code>	11-symbol Wolfram export (UQFFKozima)	FNeutronForce, SigmaSCm, SCmActivation

Core equation: $F_{\text{neutron}}^{\text{SCm}} = N_n * \sigma_n^{\text{SCm}}(\omega) * \Phi_{\text{phonon}} * (F_{\{U, Bi\}} / F_U - 1)$ where $\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 * \exp[-(\omega - \omega_{\text{SCm}})^{2/(2 * \Gamma_2)}] * (1 + [\text{SSq}] * n / 26)$

S204.2 Ramanujan 26-State Summation

Module	Purpose	Key Result
<code>ramanujan_{polylog_s26}.py</code>	Li_26([SSq]) via Euler-Ramanujan acceleration	15.7+ digits in 53 terms
<code>s26_{wstp_kernel}.py</code>	8-symbol Wolfram export (UQFFS26)	S26, R26, NaiveLi, S26VDS

Core equation: $S_{26}(z) = \text{Li}_{26}(z) = \eta_{26}(z) / (1 - 2^{\{1-26\}}) + 2^{\{1-26\} / (1 - 2^{\{1-26\}})} * \text{Li}_{26}(z^2)$

S204.3 Mock Theta Functions (26-State)

Module	Purpose	Key Result
<code>mock_{theta_q26}.py</code>	f_26(q), phi_26(q), psi_26(q) q-series	Proper q-Pochhammer (a;q)_n

Core equations: - $f_{26}(q) = \text{Sum}_{\{n=0\}^{\{25\}} q^{\{n2\}} / (-q;q)_{n^2} - \phi_{26}(q) = \text{Sum}_{\{n=0\}^{\{25\}} q^{\{n2\}} / (-q^2;q^2)_n - \psi_{26}(q) = \text{Sum}_{\{n=1\}^{\{26\}} q^{\{n2\}} / (q;q^2)_n$

S204.4 Ramanujan 1/pi with UQFF Modification

Module	Purpose	Key Result
<code>ramanujan_{pi_uqff}.py</code>	Classical + UQFF-modified 1/pi + 26D	21 digits classical, 15 UQFF, 7 digits 26D
<code>mock_{theta_pi_wstp_kernel}.py</code>	Symbol Wolfram export (UQFFMockThetaPi)	qPochhammer, f26, oneOverPiUQFF

Core equation: $1/\pi = (2\sqrt{2}/9801) \sum R_n * (1103+26390n) * W_{26}(n) / C_{26}$ where $W_{26}(n) = \text{Prod}_{\{i=1\}^{\{26\}} [1 + [SSq] \exp(-kappa_i * n/26)]$

S204.5 Calibration Constants (Canonical)

Symbol	Value	Description
[SSq]	0.57	Universal Quantized Factor
kappa	$5.787 \times 10^{-9} \text{ s}^{-1}$	UQFF exponential decay rate
beta_i	0.603	Buoyancy coupling coefficient
H_SCm	0.99	SCm manifold completeness
rho_SCm	$7.09 \times 10^{-37} \text{ kg/m}^3$	SCm vacuum density
rho_UA	$7.09 \times 10^{-36} \text{ kg/m}^3$	UA aether vacuum density
omega_SCm	$2\pi \times 1.25 \text{ THz}$	SCm phonon resonance
sigma_0	10^{-4}	Base neutron cross-section

Implementation: all modules operational in *CondensedPhysics.py*, *CondensedPhysics2.py*, *MAIN_{1_CoAnQi}.cpp*, and Wolfram kernels (*uqff_{kozima_kernel}.wl*, *uqff_{s26_kernel}.wl*, *uqff_{mock_theta_pi_kernel}.wl*).
