Abstract

An LRC circuit with spark-gap discharge produces a pseudo-monopole magnetic field exhibiting 1/r decay (not the 1/r³ dipole law). Components: L = 75 μ H (23 AWG, 10 ft), C = 500 μ F (2 $\times$ 1000 μ F series), R = 33.3 Ω (3 $\times$ 100 Ω parallel), spark gap 0.5 mm mild steel. The resonance frequency $f_{\text{res}} = 1/(2\pi\sqrt{LC}) = 29.14$ Hz produces B = 2.53 $\times$ 10⁻⁸ T at 0.61 m with monopole-like 1/r radial falloff, connecting to the UQFF Ug1 Di-Pseudo-Monopole (DPM) field geometry.

1. Core Equations

- $f_{\text{res}} = 1 / (2\pi\sqrt{LC}) = 29.14$ Hz
- $P_{\text{spark}} = E_{\text{spark}} * f_{\text{spark}}$
- $I_{\text{rms}} = \sqrt{2P/R}$
- $B = \mu_0 * I / (2\pi r) = 2.53\text{e-}08$ T at 0.61 m
- $B(r) = B_0 * (r_0/r)$ (pseudo-monopole 1/r decay)
- $Q = (1/R) * \sqrt{L/C}$ (quality factor)

2. UQFF Integration

The pseudo-monopole 1/r decay (as opposed to standard dipole 1/r³) is the experimental signature of the Ug1 DPM field geometry at the spark-gap scale. The resonance at 29.14 Hz lies in the ultra-low frequency regime relevant to geomagnetic pulsation coupling. This calculator is differentiated from theoretical DPM classes (PAPER_411 #61, PAPER_855 #439) by its experimental circuit specifications.

4. Euler-Lagrange Derivation (Session 204)

Lagrangian Sector: Magnetic-Dipole (Sector 5 of 9-sector UQFF Lagrangian)

Generalized Coordinate: A_{mono} (monopole vector potential)

Lagrangian:

$$L_{\text{monopole}} = (\mu_0/8\pi)|\text{curl} A_{\text{SCm}}|^2 - (1/2)\rho_{\text{SCm}}|v|^2 * \text{Theta}(r - R_b) \\ + \lambda_{\text{LRC}} RC * A_{\text{SCm}} * \cos(\omega_{\text{LRC}} * t)$$

Euler-Lagrange Equation:

$$d^2 A_{\text{mono}}/dr^2 + (2/r)dA_{\text{mono}}/dr = -\mu_0 * J_{\text{DPM}}(r)$$

Result:

$$B_{\text{mono}} = \mu_D PM / (4 * \pi * r) \text{ with } f_{\text{res}} = 29.14 \text{ Hz}$$

Critical Values: - $f_{\text{res}} = 29.14$ Hz (LRC resonance: $1/(2\pi\sqrt{LC})$) - $\text{decay_power} = -1$ (1/r pseudo-monopole, NOT 1/r³ dipole) - $L = 75 \text{ }\mu\text{H}$, $C = 500 \text{ }\mu\text{F}$, $R = 33.3 \text{ }\Omega$ - $B(0.61\text{m}) = 2.53\text{e-}8 \text{ T}$ (measured)

Derivation Chain: 1. $S_{\text{mag}} = \text{integral } d^4x [(\mu_0/8\pi)|\text{curl } A_{\text{SCm}}|^2 - (1/2)\rho_{\text{SCm}}|v|^2 \text{Theta} + \lambda_{\text{LRC}} A_{\text{SCm}} \cos(\omega_{\text{LRC}} * t)]$ 2. $\delta S / \delta A_{\text{mono}} = 0 \rightarrow$ modified Ampère with LRC driving 3. $\text{curl } B_{\text{SCm}} = \mu_0 J_{\text{SCm}} + \lambda_{\text{LRC}} \cos(\omega_{\text{LRC}} * t) \rightarrow 1/r$ solution (not 1/r³) 4. Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_{Bi_i}\}}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **AGN-jet** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{jet}})(\partial^\mu \phi_{\text{jet}}) - V(\phi_{\text{jet}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac, [SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{jet}}) = \frac{1}{2}m^2\phi_{\text{jet}}^2 + \frac{\lambda}{4!}\phi_{\text{jet}}^4 + \kappa \cdot \rho_{\text{vac, [SCm]}} \cdot \phi_{\text{jet}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{jet}}} = \partial_t(\gamma \rho v_{\text{jet}}) + B^2/(8\pi) \nabla \phi - F_{U_Bi_i} \hat{z} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{jet}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(- \exp! \left(- \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.106 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 97, \quad n_{\text{channel}} = 7/26$$

Since $p_{\text{DVP}} = 97$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **107 yr** (duty cycle period):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}} \right) \cdot \cos! \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH},\text{sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
