PAPER_931: SCm Phonon Linewidth E_net Evolution

Author: Daniel T. Murphy — Star Magic / UQFF Framework **Date:** 2026-04-12 **Session:** 212 **Source:** scm_{phonon_linewidth}.py (LinewidthEnetEvolution) **Calculator:** SCmPhononLinewidthEnetEvolutionCalc (CP4 #515) **CVW:** v2.0.0 compliant

Abstract

This paper explores the dependence of net energy density E_{net} on phonon linewidth Γ in the SCm (superconductive-magnetic) channel of the UQFF framework. By sweeping Γ through three regimes — narrow (0.05 THz), optimal (0.10 THz), and broad (0.30 THz) — we quantify how spectral broadening modulates the effective buoyancy energy available for gravitational coupling. The quality factor $Q = \omega_{\text{SCm}} / (2 \Gamma)$ serves as a diagnostic for resonance sharpness, with narrow linewidths yielding $Q \sim 78.5$ and broad linewidths collapsing to $Q \sim 13.1$.

1. Core Equations

The net energy density at linewidth Γ is:

$$E_{\text{net}}(\Gamma) = \rho_{\text{SCm}}(t) \cdot V \cdot \left(\frac{2F_{U,Bi}}{F_U} - 1 \right) \cdot \Phi(\omega, \Gamma) \cdot S_{26}$$

where:

- $\rho_{\text{SCm}}(t) = 9.47 \times 10^{-27} \cdot S_{26} \text{ kg/m}^3$ is the SCm vacuum density
- $S_{26} = \sum_{k=1}^{26} e^{-[\text{SSq}] \cdot k / 26}$ is the 26-layer suppression sum
- $\Phi(\omega, \Gamma)$ is the phonon flux at angular frequency ω with linewidth Γ
- $F_{U,Bi}/F_U$ is the buoyancy-to-unified field ratio

Quality factor:

$$Q = \frac{\omega_{\text{SCm}}}{2\Gamma}$$

with $\omega_{\text{SCm}} = 2\pi \times 1.25 \times 10^{12} \text{ rad/s}$.

Numerical Results

Gamma (THz)	E_net (J)	Q
0.05	Regime-dependent	78.5
0.10	Regime-dependent	39.3

Gamma (THz)	E_net (J)	Q
0.30	Regime-dependent	13.1

2. UQFF Integration

The `SCmPhononLinewidthEnetEvolutionCalc` calculator (CP4 #515) is a stateless, parameterized calculator that accepts dataset parameters `V`, `F_{U_Bi}`, `F_U`, and `[SSq]`. It sweeps across three canonical linewidth values and returns `E_net` and `Q` for each, along with primary equations in long-form.

3. Physical Significance

The linewidth `Gamma` controls the trade-off between resonance sharpness and spectral bandwidth. In the narrow regime (`Gamma` = 0.05 THz), the phonon mode couples strongly but over a limited frequency range. In the broad regime (`Gamma` = 0.30 THz), coupling is weaker per frequency bin but spans more of the phonon spectrum. The optimal linewidth (`Gamma` = 0.10 THz) balances these effects, maximizing the integrated `E_net` for typical SCm parameters.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi}i}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M– σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	$m_{\text{gap}} = 5970 \text{ GeV}$ (PAPER_1005)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)
4 (SCm)	Superconducting manifold	$V(\phi_0) = -\rho_{\text{SCm}}$ canonical
