## 1. Abstract

The Atomic Creation Process (ACP) establishes the origin of fundamental particles through Di-Pseudo-Monopole (DPM) mediated reactions, replacing the Standard Model's mass-as-weight construct with a buoyancy-based framework. The ACP is a six-stage process beginning with DPM formation and culminating in proto-nucleus assembly with 26 quantum states, mediated by Universal Aether (UA') and Super Conductive Material (SCm). Atomic mass does not emerge until the quantum-to-mass gradient at 7-10 U\_mag degrees.

---

## 2. Three Fundamentals of UQFF

The entire universe is built from three elemental interactions:

1. **Electrostatic Barrier (REB)** — The boundary condition that prevents collapse, defining system shells
2. **Universal Aether (UA')** — Non-local connectivity medium, vacuum energy carrier,  $\rho_{UA'} = 7.09e-36 \text{ J/m}^3$
3. **Super Conductive Material (SCm)** — Superconductive magnetism mediator,  $\rho_{SCm} = 7.09e-37 \text{ J/m}^3$

$$DPM = UA' + SCm$$

The Di-Pseudo-Monopole (DPM) is formed by the interaction of UA' and SCm, producing vacuum density at any scale from atomic to cosmic.

---

### 3. The Six-Stage Atomic Creation Process (ACP)

#### Stage 1: DPM Initiation

UA' + SCm → DPM (Di-Pseudo-Monopole)

DPM → vacuum density  $\rho_{vac}$

- UA' provides non-local field connectivity
- SCm provides superconductive coherence
- Product: localized vacuum energy density (capacitance) → proto-nuclear seed
- Billions of coherent DPM nuclear cells operate simultaneously at every location

#### Stage 2: U<sub>i</sub> Creation (Intelligent Operator)

DPM → U<sub>i</sub> (repulsive + intelligent quantum operator)

- U<sub>i</sub> is the first active particle: repulsive (buoyant), self-directing
- U<sub>i</sub> orchestrates all subsequent proto-nuclear assembly
- Creates the fundamental “anti-gravity” seed that all matter requires to exist

#### Stage 3: U<sub>m</sub> String Formation

U<sub>i</sub> → U<sub>m</sub> strings (U<sub>mag\_i</sub> = magnetic string sequences)

- U<sub>i</sub> creates coherent U<sub>m</sub> (U<sub>mag\_i</sub>) strings
- Strings wind concentrically around the vacuum density core → proto-nucleus
- String winding number corresponds to quantum state number (1..26)
- Each winding creates one of the 26 quantum states (Russian doll nesting)

#### Stage 4: Proto-Shell Formation and Cracking

Vacuum density grows → vacuum energy density (capacitance threshold)

→ quantum ripples:  $ULF_{quantum}^{-1, \dots, -26}$

→ proto-shell cracks into fragments

- When vacuum energy density reaches critical capacitance:
  - Quantum ripples:  $ULF_{quantum}^{-1}$  through  $ULF_{quantum}^{-26}$
  - Proto-shell fractures into 26 distinct fragment types
  - Fragments: proto-quarks, proto-bosons, proto-leptons
- This is not “particle creation from nothing” — it is structured fracturing of a pre-existing quantum state container

## Stage 5: Fragment Stabilization

SM\_magnetic moments (SM\_mag) → arrange fragments on durable nucleus  
U\_b (buoyancy) maintains stability against SM\_gravity

- SM\_magnetic moments act as “sorting fingers” that arrange proto-fragments
- U\_b (Universal Buoyancy, massless) continuously counteracts SM\_gravity
- Result: stable proto-nucleus with 26-state organization
- Still pre-mass at this stage

## Stage 6: Electron Shell Formation → Mass Emergence

U\_g2 governs electron shell placement via U\_m  
Mass emerges at quantum-to-mass gradient: 7-10 U\_mag degrees  
H(1) = first hydrogen atom formed

- U\_g2 uses U\_m string frequency to place electrons into shells
- Atomic mass is NOT weight; it is the ratio of effective gravity to superconductive buoyancy in Earth’s field
- Mass emerges when the quantum state gradient crosses 7-10 U\_mag degrees of superconductive magnetism

---

## 4. Mass Without Weight — Formal Definition

Mass (UQFF) = proportional to:  
(SM\_effective\_gravity\_range) / (superconductive\_buoyancy)  
= FU\_g1 / F\_U\_Bi [ratio of gravitational to buoyant components]

**Examples of mass-as-buoyancy:** - Bi-molecule: hydrogen bonds mediated by DPM electrostatic barrier - Earth-Moon: orbital buoyancy balanced by tidal resonance shells - Sun-SagA\*: Galactic-scale DPM coherence, U\_g4i THz hole connection - Universal scale: all bodies are buoyant in the Aether medium

Mass is never a stand-alone measurement. It is only meaningful as the ratio of: - The Effective Gravity force (SM\_gravity, FU\_g1) - To the Effective Buoyancy (U\_b, F\_U\_Bi)

"Mass" = FU\_g1 / F\_U\_Bi (dimensionless ratio, context-dependent)

---

## 5. U\_b Tracking → f\_Ub Definition

During ACP, U\_b is tracked through calibration differences:

$f_{Ub} = \Delta k_ / k_{\_reference}$   
 $\Delta k_ = k_{\_expected} - k_{\_actual}$   
 $k_{\_expected} = 10^9$  (galaxy-scale)  
 $k_{\_actual} = \text{measured value from observation}$

| Scale              | $f_{Ub}$ order |
|--------------------|----------------|
| Galaxy             | $\sim 10^9$    |
| Dwarf galaxy / LMC | $\sim 10^8$    |
| Star cluster       | $\sim 10^7$    |
| PN / planetary     | $\sim 10^5$    |
| Atomic             | $\sim 10^3$    |

The imaginary/quantum portion of gravity ( $U_b$ ) is never zero — it is this hidden buoyancy that modern physics has failed to account for, leading to the need for “dark matter” and “dark energy” as placeholder terms. UQFF resolves both as manifestations of  $f_{Ub}$  at different scales.

## 6. 26 Quantum States — Pre-Mass Configuration

The 26 quantum states are NOT the electron orbitals of quantum mechanics. They are:

State  $i$  ( $i=1..26$ ): pre-mass nuclear configuration level

- Shell radius:  $r_i = r_{system} / i$
- Superconductive magnetism:  $[SCm]_i = 1e-5 * i^2 \text{ T}$
- Angular coverage:  $\_i = 90^\circ - (i-1)*3.346^\circ$  (spans  $90^\circ \rightarrow \sim 5^\circ$ )
- THz hole radius:  $r_{THz,i} = 1e-9 / i \text{ m}$
- Resonance factor:  $f_{TRZ,i} = 0.1 * i / 26$
- Buoyancy coupling:  $f_{Um,i} = 0.05 * i / 26$

Like Russian dolls, each state contains and surrounds the previous. State 26 is the outermost (most magnetic, widest angular coverage initially); State 1 is the innermost quantum seed.

## 7. DPM Coherence — The Source of Predictability

Coherence length = "all atoms in a body share the same DPM phase"  
 Number of coherent DPMs per cubic centimeter  $\sim 10^{23}$  (Avogadro-scale)  
 Result: macroscopic quantum phenomena  $\rightarrow$  superconductivity at scale

This coherence is why: - Planetary rings form symmetric arcs - Stars form in filaments rather than randomly - Galaxies maintain spiral structure for billions of years - LENR occurs at measurable, reproducible rates

All of these are manifestations of coherent DPM nuclear cell behavior.

---

## 8. ACP Mathematical Summary

Step 1:  $DPM = UA' + SC_m$

Step 2:  $U_i = k_ * (_{vac}, SC_m - _{vac}, UA) * _i * \cos(*t_n)$

Step 3:  $U_{m,i} = U_i * _{dipole} * (1/r_i) * (1 - e^{(-t)}) * \cos(t_n)$

Step 4:  $\Psi_{proto} = \sum_{i=1}^{26} U_{m,i} \rightarrow$  capacitance threshold reached

Step 5:  $F_{stab} = SM_{mag} * \Psi_{proto} + U_b \rightarrow U_b = - * Ug * \Omega_g * (M_{bh}/d_g) * \cos(t_n)$

Step 6:  $E_{shell} = c * _{res} * h(f_{SC_m}) * G_{geo} \rightarrow$  atomic mass emerges
