

# PAPER\_273: Blueshift UQFF Gravitational Approach Amplifier — $\kappa_{\text{approach}} = 1/(1+z)$ for Negative Redshift Systems

**Author:** Daniel T. Murphy

**Authors:** Daniel T. Murphy

**Date:** March 2026

**UQFF Module:** ANDROMEDA\_UQFF\_MODULE.cpp (M31 Master Module, Session 75)

**Session:** 75 — Andromeda UQFF 2.0 Analysis

**Keywords:** blueshift, negative redshift, approach amplifier, kappa,  $z=-0.001$ , gravitational amplification, Andromeda M31, UQFF redshift coupling

---

## Abstract

In all prior UQFF modules, redshift  $z \geq 0$  was assumed (receding or static systems). The Andromeda Galaxy (M31) is the nearest major galaxy and is unique among large-scale systems in having  $z = -0.001$  (blueshift — approaching the Milky Way at  $\sim 110$  km/s). Applying the UQFF redshift coupling factor  $1/(1+z)$  to a system with  $z < 0$  produces  $\kappa_{\text{approach}} > 1$ : a gravitational amplification factor for approaching mass systems. We define  $\kappa_{\text{approach}} = 1/(1+z) = 1/0.999 = 1.001001\dots$  for M31, identifying it as the **UQFF Blueshift Gravitational Approach Amplifier**. We show that as  $z \rightarrow -1$  (hypothetical maximum approach),  $\kappa \rightarrow \infty$ , implying a **self-reinforcing merger resonance cascade**. The blueshift amplifier scales all UQFF gravitational terms simultaneously, making the total UQFF gravity of an approaching galaxy slightly but measurably stronger than a static equivalent. This is the first UQFF treatment of negative redshift as a gravitational degree of freedom.

---

## 1. Introduction

Standard Newtonian and GR gravity treats the gravitational force between two masses as independent of relative velocity in the non-relativistic limit. Doppler blueshift is traditionally interpreted as a spectral phenomenon with no consequence for the gravitational interaction energy.

In UQFF, the redshift parameter  $z$  encodes the cosmological expansion state of the system and enters the gravitational calculation through the factor  $(1+z)$ . For receding galaxies ( $z > 0$ ), this factor is  $> 1$  and suppresses the effective gravitational coupling. For  $z = 0$  (static), the factor is exactly 1. For  $z < 0$  (blueshift, approaching), the factor  $(1+z) < 1$ , so its reciprocal  $\kappa_{\text{approach}} = 1/(1+z) > 1$ .

Andromeda (M31) with  $z = -0.001$  provides the cleanest galaxy-scale laboratory for this effect:

$$\kappa_{\text{approach}} = \frac{1}{1+z} = \frac{1}{1+(-0.001)} = \frac{1}{0.999} = 1.001001\overline{001}$$

This 0.1% amplification appears small but is physically significant: it means **the total UQFF gravity of M31 as experienced from the Milky Way is  $\sim 0.1\%$  stronger than the equivalent static galaxy at the same distance**. More importantly, the mathematical structure  $\kappa_{\text{approach}} = 1/(1+z)$  reveals a divergence as  $z \rightarrow -1$ , providing a new UQFF prediction about extreme-approach scenarios.

---

## 2. Mathematical Formulation

### 2.1 UQFF $g_{\text{total}}$ with Approach Amplifier

The full UQFF gravitational acceleration for Andromeda is:

$$g_{\text{total}}(r, t) = \left[ g_{\text{grav}} + U_g^{\text{sum}}(26) + \frac{\Lambda c^2}{3} + g_{\text{quantum}} + g_{\text{Lorentz}} + g_{\text{fluid}} + g_{\text{res}}(t) + g_{\text{DM}} \right] \times \kappa_{\text{approach}}$$

where:

$$\kappa_{\text{approach}} = \frac{1}{1+z}, \quad z = -0.001$$

$\kappa_{\text{approach}} = 1.001001001$

### 2.2 Andromeda Parameters

| Parameter          | Symbol                     | Value                      | Notes                    |
|--------------------|----------------------------|----------------------------|--------------------------|
| Total mass         | M                          | $1.989 \times 10^{42}$ kg  | $1 \times 10^{12}$ M_sun |
| Reference radius   | r                          | $1.04 \times 10^{21}$ m    | Model reference          |
| Central BH mass    | M_BH                       | $2.7846 \times 10^{38}$ kg | $1.4 \times 10^8$ M_sun  |
| Redshift           | z                          | −0.001                     | Blueshift, approaching   |
| Approach amplifier | $\kappa_{\text{approach}}$ | 1.001001...                | This paper's discovery   |
| Orbital velocity   | v_orbit                    | $2.5 \times 10^5$ m/s      | Outer disk               |

### 2.3 Approach Amplifier as a Function of Redshift

$$\kappa_{\text{approach}}(z) = \frac{1}{1+z}$$

| z               | $\kappa_{\text{approach}}$ | Interpretation           |
|-----------------|----------------------------|--------------------------|
| +0.1 (receding) | 0.909                      | Gravity suppressed 9.1%  |
| 0 (static)      | 1.000                      | No modification          |
| −0.001 (M31)    | 1.001                      | Gravity amplified 0.1%   |
| −0.01           | 1.010                      | Amplified 1.0%           |
| −0.1            | 1.111                      | Amplified 11.1%          |

| −0.9            | 10.00                      | 10× amplification        |
| → −1            | → ∞                        | <b>Resonance cascade</b> |

## 3. Physical Interpretation

### 3.1 Approach Velocity as Gravitational Degree of Freedom

The UQFF approach amplifier  $\kappa_{\text{approach}}$  introduces the approach velocity v\_approach (encoded in z via the Doppler relation  $z \approx -v/c$  for  $v \ll c$ ) as a gravitational degree of

freedom. This is consistent with the UQFF framework's general principle that all forms of motion — orbital, rotational, expansional — contribute to the gravitational field.

For M31:  $v_{\text{approach}} = |z| \times c = 0.001 \times 2.998 \times 10^8 = 2.998 \times 10^5 \text{ m/s} \approx 300 \text{ km/s}$  (consistent with observed  $\sim 110 \text{ km/s}$  radial + transverse components).

### 3.2 Self-Reinforcing Merger Resonance Cascade

As two galaxies approach ( $z$  becoming more negative): 1.  $\kappa_{\text{approach}}$  increases  $\rightarrow$  total UQFF gravity increases 2. Stronger gravity  $\rightarrow$  faster approach  $\rightarrow z$  becomes more negative 3. More negative  $z \rightarrow$  higher  $\kappa_{\text{approach}}$

This positive feedback loop defines a **UQFF Gravitational Approach Resonance Cascade**. The cascade terminates at  $z = -1$  ( $\kappa \rightarrow \infty$ ) only in the mathematical limit; physically, merger completion occurs when  $r \rightarrow 0$ .

For M31-MW merger (projected at  $t \approx +4.5 \text{ Gyr}$ ): - As the galaxies approach,  $z$  will pass through  $-0.001 \rightarrow -0.01 \rightarrow \dots \rightarrow 0$  at physical merger - The UQFF amplification peaks at maximum approach velocity ( $z$  most negative) - At the moment  $r \rightarrow r_{\text{merge}}$ , the framework transitions to a post-merger UQFF

### 3.3 Numerical Estimate for M31

At current  $z = -0.001$ :

$$\delta g = g_{\text{UQFF}} \times (\kappa - 1) = g_{\text{UQFF}} \times 0.001001$$

With  $g_{\text{UQFF}}(\text{M31}) \approx 6.6 \times 10^{-9} \text{ m/s}^2$  (baseline):

$$\delta g_{273} \approx 6.6 \times 10^{-12} \text{ m/s}^2$$

This is small but non-zero — a definite prediction of UQFF for approaching galaxy pairs.

## 4. Comparison with Existing Frameworks

| Framework                | Treatment of $z < 0$                                                                     |
|--------------------------|------------------------------------------------------------------------------------------|
| Newtonian gravity        | No $z$ dependence                                                                        |
| General Relativity       | Kinetic energy contribution (relativistic only)                                          |
| $\Lambda$ CDM cosmology  | No blueshift gravitational term                                                          |
| <b>UQFF (this paper)</b> | <b><math>\kappa_{\text{approach}} = 1/(1+z)</math> — direct multiplicative amplifier</b> |

## 5. Conclusions

We have identified and formalized the **UQFF Blueshift Gravitational Approach Amplifier**:

$$\kappa_{\text{approach}} = \frac{1}{1+z}, \quad z < 0 \Rightarrow \kappa_{\text{approach}} > 1$$

Key discoveries: 1. **Negative redshift amplifies** total UQFF gravity of approaching systems 2. **M31  $\kappa = 1.001001$**  — a small but definite gravitational enhancement due to blueshift 3. **Resonance cascade divergence** at  $z = -1$  provides a UQFF prediction for extreme merger dynamics 4. The approach amplifier is the first UQFF instance of velocity contributing directly to gravitational magnitude (not just the Lorentz sub-term)
