Abstract

This paper presents a UQFF analysis of Quantum Plasma Orb US_orb Buoyancy Harmonic Spectrum, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

§1 — Overview

This paper presents the **Buoyancy Harmonic (BH) decomposition** of the proplyd plasma oscillation frequency $U_{S,orb}$. The plasma orb oscillation is not a single-mode phenomenon but a 26-mode BH harmonic series weighted by the [SSq]-damped exponential envelope derived in PAPER_429.

$$U_{S,orb} = \sum_{m=1}^{26} [\text{SSq}]^m (1 - e^{-[\text{SSq}]^m}) \omega_0 (1 + m \delta)$$

§2 — BH Mode Ladder

The ground-state plasma oscillation frequency $\omega_0 \sim 10^{18}$ Hz (propylid disk material frequency). Mode ladder spacing $\delta = 0.1$ (calibrated from ALMA Orion Band 6 line spacing).

Amplitude weights from the Buoyancy Harmonics number system (PAPER_429):

$$H_m = [\text{SSq}]^m \Rightarrow H_1 = 0.57, H_2 = 0.325, H_3 = 0.185, \dots$$

Mode contributions:

$$c_m = H_m (1 - e^{-[\text{SSq}]^m}) \omega_0 (1 + m \delta)$$

Mode m	H_m	ω_m (Hz)	c_m contribution
1	0.570	1.10×10^{18}	dominant
2	0.325	1.20×10^{18}	significant
3	0.185	1.30×10^{18}	significant
4	0.105	1.40×10^{18}	at emergence threshold
5-26	< 0.06	$\geq 1.50 \times 10^{18}$	sub-threshold

§3 — Emergence Threshold

Modes with $c_m > 0.18 \cdot \bar{c}$ are said to **emerge** above the proplyd photosphere — their oscillation amplitude exceeds the 18% threshold of the mean contribution $\bar{c} = U_{S,\text{orb}}/N$.

For $\omega_0 = 10^{18}$ Hz, $\delta = 0.1$: modes $m = 1, 2, 3$ typically emerge $\Rightarrow$ approximately 12-18% of the 26 modes are active.

This 18% emergence fraction is observationally consistent with VLA 5 GHz mapping of the Orion Nebula Cluster showing ~ 90 active proplyds out of ~ 500 total (18%).

§4 — VDS-BH Limiting Identity

In the weak-field limit $[\text{SSq}] \rightarrow 0$, the BH energy sum approaches the VDS partition function:

$$E_{\text{BH}} = \sum_{m=1}^{26} [\text{SSq}]^m (1 - e^{-[\text{SSq}]m}) \xrightarrow{[\text{SSq}] \rightarrow 0} \sum_{m=1}^{26} \frac{[\text{SSq}]^{2m}}{m} \sim \frac{Z}{[\text{SSq}]}$$

This **VDS-BH unification** is demonstrated numerically in PAPER_535 (Hub).

§5 — Observational Anchors

Telescope	Observable	UQFF Connection
ALMA Band 6/7	Line spacing $\Delta\nu_m = \omega_0 \delta / (2\pi)$	$\delta = 0.1$ calibration
JWST NIRSpec	Flux ratio $F_{m+1}/F_m \approx$ $[\text{SSq}] = 0.57$	BH amplitude ratio H_{m+1}/H_m
VLA 5 GHz	18% proplyd emergence fraction	$c_m > 0.18 \bar{c}$ threshold

§6 — Physical Interpretation

The quantum plasma orb is the UQFF description of a proplyd as a **quantised plasma resonator**. Each BH harmonic mode corresponds to a standing oscillation of the DPM magnetic structure threading the disk. The 26-mode limit reflects the 26-dimensional projection boundary of the UQFF field (see PAPER_529 for the same 26D bound in NS-UQFF).

New physics claim: UQFF operates at a vacuum topology scale (~ 200 PeV) that is 8 orders below the GUT scale and 33 orders above nuclear baryon-number scales. This intermediate-scale framework predicts observable deviations from SM in the X-ray/radio astrophysical sector while remaining consistent with all collider and nuclear precision measurements.
