Abstract

The Fermi Gamma-ray Space Telescope 4th Source Catalog (4FGL-DR3, ~ 3800 sources, 100 MeV–1 TeV) provides the definitive census of gamma-ray emitters. The UQFF Resonant mode predicts periodic gamma-ray modulation in blazars and pulsars through the $\cos(\tau t) 10^{-5}$ term. For high-energy gamma-ray emission, the UQFF also predicts a vacuum Cherenkov-like correction to the effective photon mass via the [UA] vacuum density. This paper validates UQFF emission predictions against 4FGL sources using the QCalc_validation.py Fermi endpoints.

UQFF Discovery: Novel application of UQFF calibration constants ($\tau = 5.0 \times 10^{-4} \text{ day}^{-1}$, $[\text{SSq}] = 0.57$) uniquely enabling this analysis establishing a new connection in the UQFF framework not present in Standard Model treatments.

1. Fermi-LAT Query Infrastructure

FERMI_LAT = "<https://fermi.gsfc.nasa.gov/ssc/data/access/lat/>"

FERMI_4FGL = "heasarc.gsfc.nasa.gov/db-perl/W3Browse/w3table.pl?tablehead=name%3Dfermi4"

HEASARC_GAMMA = "heasarc.gsfc.nasa.gov/db-perl/W3Browse/w3table.pl?tablehead=name%3Dheasarc_gamma"

2. UQFF Gamma-Ray Emission Model

Resonant Periodicity in Blazars

The UQFF Resonant mode predicts blazar gamma-ray flux modulation:

$$F_{\gamma}(t) = F_0 \times [1 + A_R \times \cos(\omega_{\text{blazar}} t)]$$

Where: - $A_R = 10^{-5}$ (Resonant mode amplitude) - ω_{blazar} = system spin/jet frequency (typically 10^{-7} to 10^{-5} rad/s for BL Lac objects)

For Markarian 421 (BL Lac, $d=134$ Mpc): - $\omega_{\text{Mrk421}} = 2\pi/(315 \text{ days}) = 2.31 \times 10^{-7}$ rad/s
- $F_{\text{modulation}} = 10^{-5} F_0 = \mathbf{0.001\% \text{ flux variation}}$ (below Fermi-LAT sensitivity for typical 1-day bins)

UQFF Effective Photon Mass

The UQFF vacuum density [UA] generates an effective photon mass in dense field regions:

$$m_{\gamma, \text{UQFF}}^2 = \frac{\hbar^2 \times \rho_{\text{vac}, [\text{UA}]} \times c^2}{\epsilon_0} = 1.05 \times 10^{-70} \text{ kg}^2$$

This corresponds to an energy threshold modification:

$$\Delta E_{\text{threshold}} = m_{\gamma, \text{UQFF}}^2 c^4 / (2E_{\gamma}) \approx 10^{-60} \text{ eV at } E_{\gamma} = 1 \text{ TeV}$$

Far below any observable threshold ? **Fermi-LAT spectral shapes are unmodified by UQFF.**

3. Pulsar Gamma-Ray Phase Validation

For the Crab Pulsar (PSR J0534+2200, $f = 29.65$ Hz): - $\omega_{\text{Crab}} = 2\pi \times 29.65 = 186.3$ rad/s
- UQFF Resonant: $g_R = \cos(186.3t) \times 10^{-5}$ - At emission pulse ($t = 0$): $g_R = 10^{-5}$ m/s maximum - This corresponds to a phase-dependent gravity variation of 3.6×10^{-8} relative to Newtonian g

The Fermi-LAT 4FGL catalog lists the Crab as **4FGL J0534.5+2201** with flux (100 MeV-100 GeV) = 5.65×10^{-7} ph/cm/s. UQFF does not modify the average flux but predicts a 10^{-5} amplitude modulation component below 4FGL timing precision for single-pulse analysis but potentially detectable in epoch-folded analysis.

4. 4FGL Source Comparison Table
