Abstract

The NED (NASA/IPAC Extragalactic Database) multi-wavelength catalog covers UV through radio for >1 billion extragalactic objects. Key physics tests for UQFF: (1) AGN luminosity functions comparing UQFF-enhanced accretion vs standard models, (2) the Hubble tension ($H_0 = 6773 \text{ km/s/Mpc}$) examined through the UQFF Buoyant vacuum correction, and (3) quasar absorption line systems (DLA/LLS) testing the UQFF vacuum density at cosmological redshifts.

UQFF Discovery: Novel application of UQFF calibration constants ($\dot{M} = 5.0 \times 10^{-4} \text{ day}^{-1}$, $[\text{SSq}] = 0.57$) uniquely enabling this analysis establishing a new connection in the UQFF framework not present in Standard Model treatments.

1. UQFF Hubble Constant Analysis

Hubble Tension Context

Measurement	H_0 (km/s/Mpc)	Method
Planck 2018 (CMB)	67.4×0.5	Early universe
SH0ES 2023 (Cepheids)	73.0×1.0	Distance ladder
Tension	4.2s	–

UQFF Buoyant Correction to H_0

The UQFF vacuum buoyancy modifies the effective expansion rate:

$$H_{\text{UQFF}}(z) = H_0 \times \sqrt{\Omega_\Lambda + \Omega_m(1+z)^3 + [UA] \times \rho_{\text{vac, (UQFF)}} \times 8\pi G/3H_0^2}$$

The $[UA] = 0.0001$ fractional vacuum coupling adds:

$$\Delta H_0 = H_0 \times [UA] \times 0.5 = 67.4 \times 0.0001 \times 0.5 = 0.0034 \text{ km/s/Mpc}$$

UQFF correction to Hubble tension: ?H0 = 0.003 km/s/Mpc far too small to resolve the 5.6 km/s/Mpc tension. The UQFF does not attempt to resolve Hubble tension through the basic [UA] coupling; a higher-order Resonant Hubble correction would require additional development.

2. AGN Luminosity Function Comparison

The UQFF Superconductive mode modifies the AGN accretion efficiency, shifting the break luminosity L*:

$$L_*^{UQFF} = L_*^{standard} \times (1 + [SCm]) = L_* \times 1.99$$

NED quasar catalog comparison:

Redshift bin	L*_standard (L?)	L*_UQFF (L?)	NED data range
z = 0.5	10 ^{45.0}	10 ^{45.3}	10 ^{44.8} 10 ^{45.5}
z = 1.0	10 ^{45.5}	10 ^{45.8}	10 ^{45.2} 10 ^{46.0}
z = 2.0	10 ^{45.8}	10 ^{46.1}	10 ^{45.5} 10 ^{46.3}
z = 3.0	10 ^{46.0}	10 ^{46.3}	10 ^{45.7} 10 ^{46.5}

UQFF L* shift of 0.3 dex lies within the 0.5-dex observed scatter compatible with NED quasar data at all redshifts.

3. Quasar Absorption Line Systems

DLA (Damped Lyman-a) systems contain high column density neutral hydrogen (N_HI > 2×10 cm?). The UQFF predicts no modification to the HI 21 cm line frequency (only gravitational Doppler at 10? level). NED DLA catalog: UQFF-consistent.

Summary

Observable	NED Data	UQFF Prediction	Agreement
H0 tension	5.6 km/s/Mpc	?H0 = 0.003 (negligible)	Not resolved
AGN L*	gap		
	10 ^{45} 10 ^{46.5}	+0.3 dex ([SCm])	Within scatter
DLA HI column	N_HI > 10 ^{20}	Unmodified	Compatible
