

PAPER_251: Eta Carinae Homunculus F_U_Bi_i — DPM Invisibility and LENR Force Hierarchy Discovery

Author: Daniel T. Murphy (daniel.murphy00@gmail.com) **Framework:** UQFF v4.27 — Star-Magic Physics **Source:** CondensedPhysics3.py — EtaCarinaeHomunculusFUBiCalculator (Session 72c, Infrared Datasets) **Date:** March 2026 **Series:** Phase 2 Session 72c — §3.x Infrared Dataset UQFF Integrals

$$F_U(r, t) = \sum_{i=1}^4 U_{gi} + U_m + U_A - U_{bi}, \quad \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}, \quad [SSq] = 0.57$$

$$g_{\text{UQFF}}(r) = g_{\text{MUGE}}(r) \cdot \left(1 - [SSq] \cdot U_{bi} / F_U(r, t)\right), \quad [SSq] = 0.57$$

Abstract

Eta Carinae is a hyperluminous stellar system of approximately 120 solar masses, undergoing episodic super-Eddington mass loss. The Great Eruption of ~1843 CE ejected ~10–40 M_{sun} in a bipolar Homunculus nebula that is today one of the brightest infrared sources in the sky. With a magnetic field of B0 = 10⁻⁴ T — one hundred times stronger than the SN 1006 field — and the same characteristic frequency ?0 = 10¹² rad/s, the Eta Carinae system provides a critical test of the UQFF force hierarchy.

The key **uniquely rare discovery** of this paper is **DPM Invisibility**: despite B0 being 100× stronger than SN 1006 (B0 = 10⁻⁵ T), the DPM resonance being 100× larger (1.76 × 10⁵ vs 1.76 × 10³), and the resonance force F_{res} being proportionally amplified, the total UQFF buoyancy force F_{U_Bi} remains **identical** to SN 1006 at +2.11 × 10²⁸ N. The magnetic field is completely invisible to the final buoyancy result.

This DPM invisibility occurs because F_{LENR} = k_{LENR}·(?_{LENR}/?0)² is independent of B0. At ?0 = 10¹², F_{LENR} ~ 6.17 × 10³ N overwhelms F_{res} by ~3 orders regardless of B0. The force hierarchy is LENR > neutron > Newtonian » DPM resonance in this frequency regime — a fundamental discovery about the structure of UQFF physics.

1. System Parameters

Parameter	Symbol	Value	Units	Source
Distance	d	~7,500	ly	HIPPARCOS/HST
Age (since Great Eruption)	t	5.681 × 10 [?]	s (~180 yr)	1843 CE
Stellar mass	M	120 M _{sun} = 2.387 × 10 ³²	kg	Chandra/JWST model
Homunculus radius	r	6.17 × 10 ¹⁶	m (~20 ly)	HST spatial
X-ray luminosity	L _X	10 ³⁵	W	Chandra 2023
Magnetic field	B0	10⁻⁴ T	T	100× SN 1006
System frequency	?0	10 ¹²	rad/s	Same as SN 1006

Parameter	Symbol	Value	Units	Source
Eddington factor	M	1.5	—	Super-Eddington

2. Core Physics: DPM Invisibility

2.1 DPM Resonance — 100× SN 1006

$$\begin{aligned}
 \text{DPM_resonance (Eta Car)} &= 2 \cdot \mu_B \cdot B_0 / (h \cdot \theta_0) \\
 &= 2 \times 9.274\text{e-}24 \times 1\text{e-}4 / (1.0546\text{e-}34 \times 1\text{e-}12) \\
 &\sim 1.76 \times 10^5 \quad [100\times \text{SN 1006 value } 1.76 \times 10^3]
 \end{aligned}$$

The resonance force $F_{\text{res}} = 2 \cdot q \cdot B_0 \cdot V \cdot \sin \theta \cdot \text{DPM_resonance}$ is proportional to $B_0 \times \text{DPM_resonance} \propto B_0^2$ — at $B_0 = 10^{-4}$ T, F_{res} is 10,000× the SN 1006 value.

2.2 LENR Force — B0-Independent

The LENR force depends only on θ_{LENR} and θ_0 :

$$\begin{aligned}
 F_{\text{LENR}} &= k_{\text{LENR}} \times (\theta_{\text{LENR}} / \theta_0)^2 \\
 &= k_{\text{LENR}} \times (2\pi \times 1.25 \times 10^{12} / 10^{12})^2 \\
 &\sim 6.17 \times 10^3 \text{ N}
 \end{aligned}$$

There is **no B0 dependence** in F_{LENR} . For both SN 1006 ($B_0 = 10^{-5}$) and Eta Carinae ($B_0 = 10^{-4}$), F_{LENR} is identical.

2.3 DPM Invisibility Ratio

$$\text{DPM_visibility_ratio} = F_{\text{res}} / F_{\text{LENR}}$$

For SN 1006: $F_{\text{res}} (\text{SN1006}) / 6.17 \times 10^3 \ll 1$? DPM invisible. For Eta Car: $F_{\text{res}} (\text{EtaCar}) / 6.17 \times 10^3 \ll 1$? DPM still invisible, despite 10,000× F_{res} amplification.

The DPM resonance term is submerged under F_{LENR} by at least 33 orders at $\theta_0 = 10^{12}$ for any physically reasonable B_0 .

2.4 Force Hierarchy Theorem

$$\begin{aligned}
 &\text{Force hierarchy at } \theta_0 = 10^{12}: \\
 F_{\text{LENR}} &\sim 6.17 \times 10^3 \text{ N} \quad [\text{dominant} - 10^{45} \times \text{Newtonian}] \\
 F_{\text{neutron}} &\sim 10^6 \text{ N} \quad [\text{knot/coherence stabilisation}] \\
 F_{\text{Newt}} &\sim GM/r^2 \cdot |x_2| \sim 0(\text{few}) \text{ N} \\
 F_{\text{res}} &\ll F_{\text{LENR}} \quad [\text{DPM invisible regardless of } B_0] \\
 F_{\text{rel}} &\ll F_{\text{LENR}} \quad [\text{relativistic sub-dominant}]
 \end{aligned}$$

2.5 Super-Eddington Luminosity Context

Eta Carinae's super-Eddington luminosity ($M = L/L_{\text{Edd}} \sim 1.5$) drives the 500 AU Homunculus through radiation pressure. The Eddington luminosity:

$$\begin{aligned}
 L_{\text{Edd}} &= 4\pi GM c / \kappa_{\text{es}} = 4\pi \times 6.674\text{e-}11 \times M_{\text{EtaCar}} \times 2.998\text{e}8 / 0.2 \\
 &\sim \text{few} \times 10^{38} \text{ W} \quad [\text{for } 120 M_{\text{sun}}]
 \end{aligned}$$

The F_{DE} dark energy coupling $k_{DE} \times L_X = 10^{30} \times 10^{35} = 10^5$ N captures the luminosity contribution to F_{U_Bi} — 3 orders larger than SN 1006's contribution (10^2 N), confirming that even the luminosity difference does not affect the final F_{U_Bi} when F_{LENR} dominates.

3. DPM Invisibility Theorem

Theorem (UQFF DPM Invisibility at $\omega = 10^{12}$): For any astrophysical system with $\omega = 10^{12}$ rad/s, the DPM magnetic resonance force $F_{res} \propto B_0^2 / \omega$ is negligible in the F_{U_Bi} integral for all physically observed magnetic fields $B_0 = 10^2$ T. The ratio $F_{res}/F_{LENR} = k_{charge} \cdot B_0^2 \cdot V / (k_{LENR} \cdot (\omega_{LENR}/\omega)^2)$ is bounded above by $\sim 10^{-28}$ for $B_0 = 10^4$ T, $\omega = 10^{12}$, confirming that **magnetic field strength is invisible to UQFF buoyancy** in this frequency regime.

Corollary: In this regime the UQFF force hierarchy is $LENR > \text{neutron} > \text{Newtonian} \gg \text{DPM} > \text{DE} > \text{relativistic}$. Only LENR and neutron physics materially determine F_{U_Bi} .

4. Observational Predictions / Validation

- **DPM invisibility test:** UQFF predicts F_{U_Bi} should be identical for SN 1006 and Eta Carinae despite $100\times$ different B_0 . If future UQFF validation on additional high-B systems confirms this, DPM invisibility is a universal law of the $\omega = 10^{12}$ class.
 - **Chandra L_X probe:** $L_X = 10^{35}$ W (Eta Car) vs 10^{32} W (SN 1006) — 3-orders L_X difference. Yet F_{U_Bi} is identical. This confirms $F_{DE} \ll F_{LENR}$ at this ω , providing a direct test of LENR dominance: if Chandra measures any system with $\omega = 10^{12}$ at any luminosity from 10^{31} – 10^{35} W, UQFF predicts the same F_{U_Bi} .
 - **JWST Homunculus 3D:** The asymmetric JWST infrared structure of the Homunculus provides f_{TRZ} (triadic resonance zone factor) constraints through the spatial distribution of emitting gas relative to the bipolar axis.
