

PAPER_312: NGC 6302 Central Star UV Radiation Pressure — UQFF Photoionization Gravitational Signature

Subtitle: FIRST UQFF Hot-WD UV Radiation Parameter — $\eta_{\text{rad}} = 1.913 \times 10^{20}$; $a_{\text{rad}} = 5.672 \times 10^8 \text{ m/s}^2$

Author: Daniel T. Murphy

Session: 89 | **Date:** March 17, 2026

Module: NGC6302_UQFF_MODULE.cpp (31st C++ UQFF module)

WOLFRAM_TERM: NGC6302_UV_RADIATION

UQFF First: FIRST UQFF explicit UV-bright white dwarf ($T_{\text{eff}} = 200,000 \text{ K}$) photon-pressure gravitational signature

Abstract

This paper presents UQFF derivations and numerical results for: PAPER_312: NGC 6302 Central Star UV Radiation Pressure — UQFF Photoionization Gravitational Signature. Calibration constants: $\kappa = 0.0005/\text{day}$, $[\text{SSq}] = 0.57$. Results validated against observational data and prior UQFF whitepaper series.

1. System Parameters

Parameter	Value	Notes
$T_{\text{eff_star}}$	$2.0 \times 10^5 \text{ K}$	Central WD effective temperature
L_{star}	$1.914 \times 10^{30} \text{ W}$	$= 5000 L_{\text{sun}}$ (Zanstra temperature analysis)
r	$9.46 \times 10^{15} \text{ m}$	PN half-lobe radius
ρ_{fluid}	$1.0 \times 10^{-20} \text{ kg/m}^3$	Ionized lobe gas density
c	$3.0 \times 10^8 \text{ m/s}$	Speed of light

2. Unique Physics

2.1 Central Star Luminosity

NGC 6302's central star is one of the hottest white dwarfs known, with $T_{\text{eff}} \approx 200,000 \text{ K}$ (Szyszka et al. 2009, ApJL). The Zanstra hydrogen luminosity gives:

$$L_{\text{star}} = 5000 L_{\odot} = 5000 \times 3.828 \times 10^{26} \text{ W} = 1.914 \times 10^{30} \text{ W}$$

2.2 Radiation Pressure at Lobe Radius

The photon radiation pressure at lobe radius r for an isotropic point source:

$$P_{\text{rad}} = \frac{L_{\text{star}}}{4\pi r^2 c}$$

$$4\pi r^2 = 4\pi \times (9.46 \times 10^{15})^2 = 4\pi \times 8.949 \times 10^{31} = 1.125 \times 10^{33} \text{ m}^2$$

$$P_{rad} = \frac{1.914 \times 10^{30}}{1.125 \times 10^{33} \times 3.0 \times 10^8} = \frac{1.914 \times 10^{30}}{3.375 \times 10^{41}} = \mathbf{5.672 \times 10^{-12} \text{ Pa}}$$

2.3 Radiation-Pressure Acceleration

$$a_{rad} = \frac{P_{rad}}{\rho_{fluid}} = \frac{5.672 \times 10^{-12}}{1.0 \times 10^{-20}} = \mathbf{5.672 \times 10^8 \text{ m/s}^2}$$

2.4 Radiation-to-Gravity Dominance Ratio

$$\eta_{rad} \equiv \frac{a_{rad}}{g_{base}} = \frac{5.672 \times 10^8}{2.967 \times 10^{-12}} = \mathbf{1.913 \times 10^{20}}$$

The UV radiation pressure exceeds gravitational force by **1.913×10^{20}** — twenty orders of magnitude. This establishes that photoionization-driven radiation pressure is the primary mechanism for lobe acceleration in bipolar PNe with ultra-hot central stars.

3. UQFF Pipeline Term

In the full UQFF 2.0 pipeline, the UV radiation acceleration enters as an independent additive term:

$$g_{NGC6302}^{(rad)} = \frac{L_{star}}{4\pi r^2 c \rho_{fluid}}$$

This term dominates over the wind shock term (PAPER_311: $a_{wind} \sim 10^{-6} \text{ m/s}^2$) by a further **14 orders of magnitude**, placing radiation pressure at the apex of the NGC 6302 UQFF force hierarchy.

Force Hierarchy (descending):

1. $a_{rad} = 5.672 \times 10^8 \text{ m/s}^2$ — UV radiation pressure (PAPER_312, **DOMINANT**)
 2. $a_{wind} = 2.114 \times 10^{-6} \text{ m/s}^2$ — wind shock (PAPER_311)
 3. $g_{base} = 2.967 \times 10^{-12} \text{ m/s}^2$ — gravitational binding
-

4. Astrophysical Context

The UV radiation from NGC 6302's central star ($T_{eff} = 200,000 \text{ K}$) photoionizes the surrounding gas, producing the characteristic bipolar emission nebula observed in [O III], H-alpha, and UV by HST/WFC3. The radiation pressure parameter $\eta_{rad} = 1.913 \times 10^{20}$ confirms that the nebular gas is radiation-pressure dominated at all scales up to the lobe boundary.

The UQFF formulation explicitly identifies this as a distinct gravitational-equivalent acceleration channel, separable from wind shock effects and magnetic confinement — providing the first three-component force budget for a bipolar PN within the UQFF framework.

5. Key Results

Quantity	Value	Unit
L_star (5000 L_sun)	1.914×10^{30}	W
P_rad at r=1 ly	5.672×10^{-12}	Pa
a_rad	5.672×10^8	m/s ²
η_{rad}	1.913×10^{20}	dimensionless
a_rad / a_wind	2.684×10^{14}	dimensionless

6. Classification

- **UQFF First:** FIRST UQFF explicit hot-WD UV radiation parameter ($T_{\text{eff}} = 200,000$ K class)
- **Scale:** Stellar (PN lobe scale, ~ 1 ly)
- **Physics category:** Photoionization / UV radiation pressure / force hierarchy
- **Cross-references:** PAPER_311 (wind shock), PAPER_313 (torus magnetic confinement)
