

PAPER_322 CR34: Intra-HII THz Geometric Amplification Differential (Orion/Lagoon ratio = 8.59)

Module: COMPRESSED_RESONANCE_UQFF34_MODULE.cpp

Session: 92 | **Date:** March 18, 2026

Author: Daniel T. Murphy

Classification: FIRST UQFF intra-HII THz geometric amplification differential identical DPM class yields different THz acceleration from geometry alone

Abstract

Orion Nebula M42 (sys34) and Lagoon Nebula M8 (sys30) share the same DPM class parameters ($f_{\text{DPM}}=10^{11}$ Hz, $f_{\text{THz}}=10^{11}$ Hz, $v_{\text{exp}}=10^4$ m/s), yet differ geometrically (A_{vort} , V_{sys}). Their Γ_{THz} factors are identical (3.333×10^6), but the THz accelerations differ by factor 8.59, attributable entirely to geometric DPM density coupling. This is the **first UQFF intra-HII THz geometric amplification differential**.

System Parameters

Parameter	Orion (sys34)	Lagoon (sys30)
f_{DPM}	10^{11} Hz	10^{11} Hz
f_{THz}	10^{11} Hz	10^{11} Hz
v_{exp}	10^4 m/s	10^4 m/s
I_{curr}	10^2 A	10^2 A
A_{vort}	$3.142 \times 10^3 \text{ m}^2$	$3.142 \times 10^3 \mu\text{m}^2$
V_{sys}	$6.887 \times 10^3 \text{ m}^3$	$5.913 \times 10^3 \mu\text{m}^3$

Equations

DPM acceleration:

$$a_{\text{DPM}} = \frac{I \cdot A_{\text{vort}} \cdot \omega_{\text{diff}} \cdot f_{\text{DPM}} \cdot E_{\text{vac}}}{c \cdot V_{\text{sys}}}$$

THz amplification factor (identical for both):

$$\Gamma_{\text{THz}} = \frac{10 \cdot f_{\text{THz}} \cdot v_{\text{exp}}}{c} = \frac{10 \times 10^{11} \times 10^4}{3 \times 10^8} = 3.333 \times 10^6$$

THz acceleration:

$$a_{\text{THz}} = \Gamma_{\text{THz}} \cdot a_{\text{DPM}}$$

Numerical Computation

Orion (sys34):

$$a_{\text{DPM},34} = \frac{10^{20} \times 3.142 \times 10^{34} \times 2 \times 10^{-2} \times 10^{11} \times 7.09 \times 10^{-36}}{3 \times 10^8 \times 6.887 \times 10^{51}}$$

$$= \frac{3.142 \times 10^{20} \times 2 \times 10^{-2} \times 7.09 \times 10^{-36}}{3 \times 10^8 \times 6.887} = \frac{4.459 \times 10^{-19}}{2.066 \times 10^9} \approx 2.156 \times 10^{-28} \text{ m/s}^2$$

Wait let me use full precision:

$$\text{numerator} = 1e20 \times 3.142e34 \times 2e-2 \times 1e11 \times 7.09e-36 = 4.459e19$$

$$\text{denominator} = 3e8 \times 6.887e51 = 2.066e60$$

$$a_{\text{DPM},34} = 4.459e19 / 2.066e60 = \mathbf{2.156 \times 10^{-41} \text{ m/s}^2} \quad (\text{negligible; the amplified term is significant})$$

$$a_{\text{THz},34} = 3.333 \times 10^6 \times 2.156 \times 10^{-41} = 7.187 \times 10^{-35} \text{ m/s}^2$$

Lagoon (sys30):

$$a_{\text{DPM},30} = \frac{10^{20} \times 3.142 \times 10^{35} \times 2 \times 10^{-2} \times 10^{11} \times 7.09 \times 10^{-36}}{3 \times 10^8 \times 5.913 \times 10^{53}}$$

$$\text{numerator} = 1e20 \times 3.142e35 \times 2e-2 \times 1e11 \times 7.09e-36 = 4.459e20$$

$$\text{denominator} = 3e8 \times 5.913e53 = 1.774e62$$

$$a_{\text{DPM},30} = 4.459e20 / 1.774e62 = \mathbf{2.513 \times 10^{-42} \text{ m/s}^2}$$

$$a_{\text{THz},30} = 3.333 \times 10^6 \times 2.513 \times 10^{-42} = 8.375 \times 10^{-36} \text{ m/s}^2$$

THz Ratio

$$\frac{a_{\text{THz},34}}{a_{\text{THz},30}} = \frac{\Gamma_{\text{THz}} \cdot a_{\text{DPM},34}}{\Gamma_{\text{THz}} \cdot a_{\text{DPM},30}} = \frac{a_{\text{DPM},34}}{a_{\text{DPM},30}}$$

Since Γ_{THz} cancels:

$$\begin{aligned} \text{ratio} &= \frac{A_{\text{vort},34}/V_{\text{sys},34}}{A_{\text{vort},30}/V_{\text{sys},30}} = \frac{3.142 \times 10^{34}/6.887 \times 10^{51}}{3.142 \times 10^{35}/5.913 \times 10^{53}} \\ &= \frac{4.562 \times 10^{-18}}{5.313 \times 10^{-19}} = \boxed{8.59} \end{aligned}$$

Physical Interpretation

Despite sharing the same DPM frequency class ($f_{\text{DPM}} = f_{\text{THz}} = 10^{\hat{1}}\hat{1}^1 \text{ Hz}$) and expansion velocity, Orion produces **8.59** $\hat{\text{A}}$ **more THz acceleration** than the Lagoon Nebula. The ratio is determined entirely by the geometric DPM surface-density ratio $A_{\text{vort}}/V_{\text{sys}}$:

- **Orion** is geometrically **denser** (smaller V , similar A_{vort} order): higher DPM surface density
- **Lagoon** has $10\hat{\text{A}}$ larger A_{vort} but $100\hat{\text{A}}$ larger V_{sys} $\hat{\text{A}}$ lower surface density

This result demonstrates that **DPM geometry ($A_{\text{vort}}/V_{\text{sys}}$) is the primary modulator** of THz acceleration within an HII region DPM class, independent of f_{DPM} , f_{THz} , or v_{exp} .
