

# PAPER\_694: Crab Nebula (M1/NGC 1952): SNR + Pulsar Wind Nebula UQFF

**Class:** CrabNebulaPWNUQFF

**CP4 Entry:** #278

**Keywords:** Crab Nebula, M1, SNR, PWN, spin-down luminosity, Sedov-Taylor, pulsar, UQFF

**Session:** 174 | **Version:** v5.31

**Source:** grok\_share\_ba508f76c8e.txt

## Abstract

The Crab Nebula (M1/NGC 1952) is the remnant of SN 1054, containing a 33 ms pulsar driving a powerful pulsar wind nebula (PWN). UQFF modifications to the Sedov-Taylor expansion and synchrotron emission are derived.

## 1. Parameters

| Parameter    | Value               |
|--------------|---------------------|
| $M_{ejecta}$ | $4.6M_{\odot}$      |
| $E_{SN}$     | $10^{44}$ J         |
| $P_{pulsar}$ | 33 ms               |
| $B_{pulsar}$ | $3.8 \times 10^8$ T |
| Age          | 971 yr              |

## 2. Spin-Down Luminosity

$$L_{sd} = I|\Omega\dot{\Omega}|, \quad \dot{\Omega} = -\frac{B^2 R_{ns}^6 \Omega^3}{6Ic^3}$$

$$L_{sd}(Crab) \approx 5 \times 10^{31} \text{ W.}$$

## 3. UQFF SNR Expansion

$$v_{SNR,UQFF} = \sqrt{\frac{2E_{SN}(1-f_{TRZ})}{M_{ej}}} \left(1 + \frac{\rho_{SCm}}{\rho_{UA}}\right)$$

## 4. Synchrotron Cooling

$$t_{sync} = \frac{9m_e^3 c^5}{4r_e^2 m_e c B^2 \gamma_e}$$

## 5. Sedov-Taylor Phase

$$R_{SNR}(t) = \left(\frac{E_{SN}}{\rho_0}\right)^{1/5} t^{2/5} \cdot \xi_0, \quad \xi_0 \approx 1.15$$
