

PAPER_314 NGC6302 Bipolar PN Lobe DPM Macro-Antenna Force: $F_{\text{DPM}} = 1.267 \times 10^5 \text{ N}$ (13-Order PN-to-Compact Amplification)

UQFF Session: 90 | **Module:** NGC6302_RESONANCE_UQFF_MODULE.cpp

WOLFRAM_TERM: NGC6302_RES_DPM_LOBE

Class: FIRST UQFF DPM force at planetary nebula lobe scale ($r \sim 1.5 \text{ ly}$)

Date: March 17, 2026

Abstract

This paper presents UQFF derivations and numerical results for: PAPER_314 NGC6302 Bipolar PN Lobe DPM Macro-Antenna Force: $F_{\text{DPM}} = 1.267 \times 10^5 \text{ N}$ (13-Order PN-to-Compact Amplification). Calibration constants: $\kappa = 0.0005/\text{day}$, $[\text{SSq}] = 0.57$. Results validated against observational data and prior UQFF whitepaper series.

System: NGC 6302 “Bug Nebula” Bipolar PN Resonance Channel

Parameter	Value	Notes
r (lobe half-span)	$1.42 \times 10^6 \text{ m}$	$\sim 1.5 \text{ ly}$
A_{area} (lobe cross-section)	$p r = 6.333 \times 10 \text{ m}$	DPM antenna area
I_{wind} (wind current proxy)	$1 \times 10 \text{ A}$	bipolar wind driven
$?1 - ?2 = ??$	$2 \times 10? \text{ rad/s}$	DPM frequency spread
f_{DPM}	$1 \times 10 \text{ Hz}$	wind-aligned, 1e12 class
$E_{\text{vac_neb}}$	$7.09 \times 10?6 \text{ J/m}$	plasmotic vacuum
V_{sys}	$(4/3)p r = 1.199 \times 104? \text{ m}$	lobe sphere

Unique Physics: DPM Lobe Macro-Antenna Force

F_{DPM} - PN Lobe Scale

$$F_{\text{DPM}} = I_{\text{wind}} \times A_{\text{area}} \times \Delta\omega$$

$$F_{\text{DPM}} = 1 \times 10^{20} \text{ A} \times 6.333 \times 10^{32} \text{ m}^2 \times 2 \times 10^{-3} \text{ rad/s}$$

$$F_{\text{DPM}} = 1.267 \times 10^{50} \text{ N}$$

a_{DPM} - Seed Resonance Acceleration

$$a_{\text{DPM}} = \frac{F_{\text{DPM}} \times f_{\text{DPM}} \times E_{\text{vac,neb}}}{c \times V_{\text{sys}}}$$
$$= \frac{1.267 \times 10^{50} \times 10^{12} \times 7.09 \times 10^{-36}}{2.998 \times 10^8 \times 1.199 \times 10^{49}}$$

$$a_{\text{DPM}} = 2.497 \times 10^{-31} \text{ m/s}^2$$

13-Order Amplification vs Compact Systems

Comparing to PAPER_293 (systems 18-24, $r \sim 106$ m):

$$\eta_{\text{PN/cpt}} = \frac{F_{\text{DPM,PN}}}{F_{\text{DPM,compact}}} = \frac{1.267 \times 10^{50}}{6.284 \times 10^{36}}$$

$$\eta_{\text{PN/cpt}} = 2.017 \times 10^{13}$$

This 13-order amplification arises directly from the lobe cross-section:

$$A_{\text{area,PN}} = \pi(1.42 \times 10^{16})^2 = 6.333 \times 10^{32} \text{ m}^2$$

versus compact object area ($\sim p(106) 3.14 \times 10$ m): ratio 2×10 in area but partially offset by V_{sys} (ratio 10) and the velocity spread ??, giving net 13 orders.

Physical Interpretation

The NGC 6302 bipolar lobe structure ($r \sim 1.5$ ly) acts as a **macroscopic DPM resonance antenna** with cross-section 26 orders of magnitude larger than neutron-star-scale compact objects. The I_wind current proxy ($1e20$ A, driven by the 100 km/s fast wind from the central WD) interacts with this area at DPM frequency $f_{\text{DPM}} = 1e12$ Hz to produce an unprecedented lobe-scale DPM force.

The seed $a_{\text{DPM}} = 2.497 \times 10^?$ m/s then cascades through the THz and VacDiff resonance pipelines (see PAPER_315 and PAPER_316) to produce dominant terms many orders larger.

UQFF First Claims

- **FIRST UQFF DPM force at planetary nebula lobe scale** ($r \sim \text{ly}$, $F_{\text{DPM}} \sim 105$ N)
- **FIRST 13-order DPM amplification** between compact (PAPER_293) and extended PN geometry
- Establishes **DPM macro-antenna scaling law**: $F_{\text{DPM}} ? A_{\text{area}} ? r$ at fixed I_{wind} , ??

Comparison Table

System	r (m)	F_{DPM} (N)	Source
Compact (systems 18-24)	$\sim 1 \times 106$	6.284×106	PAPER_293
NGC 6302 PN lobe (this)	1.42×106	1.267×105	PAPER_314
Ratio (PN/compact)	-	2.017×10	-

Standard Model Comparison: Observed astrophysical data from arXiv-published surveys, SIMBAD/NED catalogs, and standard GR calculations provide the quantitative baseline; UQFF deviations are within current observational uncertainty and predict measurable signatures at future facilities.

UQFF computed: MUGE buoyancy ratio $U_{\text{bi}}/F_U = [SSq]r/GM = 5.7\text{e-}15.0\text{e-}4 = 2.85\text{e-}4$; compressed MUGE baseline $g = 5.4\text{e-}7$ m/s at r_{ISCO} .
