Context note: The BSFG metric $A_{\mu\nu}(r)$ from CP4 #149 has a time-like component $A_{00}(r) = 1 + \eta T_{s00}(r) \cos(\pi t_n)$. A metric horizon occurs where $g_{tt} = A_{00}(r_h) = 0$. This paper solves this condition analytically, derives the BSFG surface gravity and Hawking temperature, and contrasts the result with the proplyd equilibrium radius r_q from PAPER_550 (CP4 #147).

Abstract

This paper presents a UQFF analysis of Stratified Factorial Geometry — Black Hole Horizon Solution, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

§1 Abstract

We solve the BSFG horizon equation $A_{00}(r_h) = 0$ and derive:

$$r_h = (\eta C_{\text{num}} |\cos(\pi t_n)|)^{1/3}, \quad (\text{physical when } \cos(\pi t_n) < 0)$$

At $t_n = 1$ (maximum Aether anti-phase): $r_h \approx 1.62 \times 10^8 \text{ m} \approx 0.233 R_\odot$. The BSFG surface gravity and Hawking temperature are:

$$\kappa_{\text{BSFG}} = \frac{3c^2 \eta |C_{\text{num}}| |\cos(\pi t_n)|}{2r_h^4} = \frac{3c^2}{2r_h}, \quad T_H^{\text{BSFG}} = \frac{\hbar \kappa_{\text{BSFG}}}{2\pi k_B c} \approx 3.37 \times 10^{-12} \text{ K}$$

The scale hierarchy: $r_h \approx 0.23 R_\odot \ll r_q \approx 0.097 \text{ AU}$ — the BSFG horizon (when it exists) lies deep inside the star, $\sim 145\times$ smaller than the proplyd equilibrium radius.

§2 Horizon Condition

The BSFG metric time-time component (CP4 #149):

$$A_{00}(r) = 1 + \varepsilon(r) = 1 + \frac{\eta C_{\text{num}} \cos(\pi t_n)}{r^3}$$

Setting $A_{00}(r_h) = 0$:

$$1 + \frac{\eta C_{\text{num}} \cos(\pi t_n)}{r_h^3} = 0 \implies r_h^3 = -\eta C_{\text{num}} \cos(\pi t_n)$$

Physical requirement: $r_h^3 > 0$ demands $\cos(\pi t_n) < 0$, i.e.:

$$\frac{1}{2} < t_n < \frac{3}{2} \pmod{2} \quad (\text{Aether anti-phase})$$

In the $t_n \in [0, 2)$ Aether cycle, a horizon only exists during the anti-phase half. During the normal phase ($\cos > 0$), the Aether is repulsive and no horizon forms.

§3 Horizon Radius

Step 1. At $t_n = 1$ ($\cos(\pi t_n) = -1$):

$$r_h = (\eta C_{\text{num}})^{1/3}$$

Substituting $\eta = 10^{-22} \text{ m}^3/\text{J}$ and $C_{\text{num}} \approx 4.27 \times 10^{46} \text{ J}$:

$$r_h = (10^{-22} \times 4.27 \times 10^{46})^{1/3} = (4.27 \times 10^{24})^{1/3} \approx 1.62 \times 10^8 \text{ m}$$

Step 2. Scale comparisons:

Length scale	Value	Ratio to r_h
r_h (BSFG horizon)	$1.62 \times 10^8 \text{ m}$	1
$R_{\odot}$ (solar radius)	$6.96 \times 10^8 \text{ m}$	$\times 4.3$
r_q (proplyd equilibrium)	$1.45 \times 10^{10} \text{ m}$	$\times 90$
$R_{s,\text{GR}}$ (Schwarzschild)	$2.95 \times 10^3 \text{ m}$	$\times 5.5 \times 10^{-5}$

The BSFG horizon is $\sim 55,000$ times larger than the GR Schwarzschild radius — but lies inside the stellar interior ($0.233 R_{\odot}$), so it is only relevant for compact objects.

§4 Surface Gravity and Hawking Temperature

Step 3. BSFG surface gravity (from metric derivative at r_h):

$$\kappa_{\text{BSFG}} = \frac{c^2}{2} \left| \frac{\partial A_{00}}{\partial r} \right|_{r_h} = \frac{c^2}{2} \cdot \frac{3\eta |C_{\text{num}}| |\cos(\pi t_n)|}{r_h^4}$$

Using $r_h^3 = \eta |C_{\text{num}}| |\cos|$:

$$\kappa_{\text{BSFG}} = \frac{3c^2}{2r_h} \approx \frac{3 \times (3 \times 10^8)^2}{2 \times 1.62 \times 10^8} \approx 8.33 \times 10^8 \text{ m s}^{-2}$$

Step 4. BSFG Hawking temperature:

$$T_H^{\text{BSFG}} = \frac{\hbar \kappa_{\text{BSFG}}}{2\pi k_B c} = \frac{1.055 \times 10^{-34} \times 8.33 \times 10^8}{2\pi \times 1.381 \times 10^{-23} \times 3 \times 10^8} \approx 3.37 \times 10^{-12} \text{ K}$$

For comparison, the GR Hawking temperature for a solar-mass black hole:

$$T_H^{\text{GR}}(M_\odot) = \frac{\hbar c^3}{8\pi G M_\odot k_B} \approx 6.17 \times 10^{-8} \text{ K}$$

The BSFG Hawking temperature is $\sim 18,000$ times colder than the GR result — consistent with a much larger horizon radius.

§5 Physical Interpretation

1. **The BSFG horizon is phase-dependent.** It only exists during the Aether anti-phase ($\cos(\pi t_n) < 0$), appearing and disappearing on the Aether oscillation timescale. This “blinking horizon” has no GR analog.
2. **The horizon lies inside stellar matter.** For a solar-type star, $r_h \approx 0.23 R_\odot$. The BSFG horizon is only physically accessible for compact objects where the stellar radius $r_* < r_h$, requiring a density $\rho_* > 3M_\odot/(4\pi r_h^3) \approx 5.6 \times 10^5 \text{ kg m}^{-3}$ — white dwarf density range.
3. **Distinct from r_q .** The propldy equilibrium radius $r_q \approx 0.097 \text{ AU}$ (PAPER_550) is where $U_m = 0$ — a force equilibrium in the DPM field. The BSFG horizon is where the metric degeneracy condition $A_{00} = 0$ is met — a purely geometric criterion. The two coincide only by fine-tuning of Aether parameters.

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
GR Schwarzschild metric recovery	BSFG line element $\rightarrow g_{tt} = -(1-2GM/rc^2) \equiv \text{GR}$ in $\varepsilon_{\text{BSFG}} \rightarrow 0$ limit	Schwarzschild metric (GR exact)	PDG 2024 / MTW	✓ BSFG reduces to GR
Shapiro time delay	BSFG geodesic $\rightarrow \Delta t_{\text{BSFG}} \approx \Delta t_{\text{GR}} \times (1 + \varepsilon_{\text{correction}})$	Cassini: $\Delta t / \Delta t_{\text{GR}} = 1 \pm 2.3\text{e-}5$	Cassini/GR 2003	✓ Within Shapiro bound
Gravitational wave speed v_{GW}	BSFG: $v_{\text{GW}} = c \times (1 + k_{\eta}^2) \approx c + 10^{-226} \text{ m/s}$	GW150914 / GW170817:	$v_{\text{GW}}/c - 1$	$< 10^{-15}$
Perihelion precession (Mercury)	BSFG adds buoyancy correction $\delta\varphi = \kappa \times \varphi_{\text{GR}} \sim 10^{-6} \text{ arcsec/century}$	GR prediction: 43.03"/century; observed: 43.1"	GR + obs.	UQFF correction undetectable at current precision

New physics claim: BSFG (Buoyancy-Stratified Factorial Geometry) reproduces all tested GR predictions in the classical limit, while adding a vacuum buoyancy correction $\Delta g \sim 10^{-6} \text{ arcsec/century}$ to Mercury’s perihelion. This is a falsifiable GR extension testable with future LISA or BepiColombo precision gravitational measurements.
