

PAPER_731: NGC 1316 (Fornax A) Merger-Driven Elliptical Galaxy Evolution MUGE

Class: NGC1316MergerEvolutionCalculator **CP4 Entry:** #315 **Keywords:** NGC 1316, Fornax A, elliptical galaxy, merger, MUGE, AGN, dust lanes, dark matter, globular clusters, Hubble ACS **Session:** 177 | **Version:** v5.34 **Source:** grok_share_ba508f76c8e.txt entry #64

Abstract

NGC 1316 (Fornax A), the dominant radio galaxy of the Fornax cluster at $z = 0.005$ ($d \approx 23$ Mpc), encodes a recent spiral merger in its prominent dust lanes and anomalously blue globular cluster population imaged by Hubble ACS. A full MUGE gravity model is derived incorporating time-decaying merger mass $M(t)$, AGN magnetic field suppression, environmental tidal and cluster forces, all four UQFF U_{g1} - U_{g4} potentials, the U_i information-flux term, cosmological constant Λ , a Gaussian dust-lane quantum wavefunction ψ_{dust} , and a dark matter perturbation correction. The master equation reproduces the observed flat rotation curve at $r = 46$ kpc and predicts the merger progenitor decay timescale $\tau_{merge} \approx 1$ Gyr.

1. System Parameters

Parameter	Symbol	Value
Visible stellar mass	M_{vis}	$3.5 \times 10^{11} M_{\odot}$
Dark matter halo	M_{DM}	$1.5 \times 10^{11} M_{\odot}$
Black hole mass	M_{BH}	$10^8 M_{\odot}$
Merger progenitor mass	M_{spiral}	$10^{10} M_{\odot}$
Merge decay timescale	τ_{merge}	$10^9 \text{ yr} = 3.156 \times 10^{16} \text{ s}$
Galaxy radius	r_0	46 kpc
Spiral progenitor distance	d_{spiral}	50 kpc
Dust lane σ	σ_{dust}	2 kpc
Redshift	z	0.005
AGN magnetic field	B_{AGN}	10^{-4} T
Critical field	B_{crit}	10^{11} T
BH spin rate	ω_{spin}	10^{-3} rad/s
Aether field	H_{aether}	10^{-5} A/m
Dust density	ρ_{dust}	10^{-21} kg/m^3
Galaxy volume	V_{gal}	10^{51} m^3
Cluster coupling	$k_{cluster}$	$10^{-12} \text{ N/M}_{\odot}$

2. Time-Dependent Mass and Radius

The merger mass decays exponentially:

$$M(t) = M_{vis} + M_{DM} + M_{spiral} e^{-t/\tau_{merge}}$$

At $t = 0$: $M(0) \approx 5.01 \times 10^{11} M_{\odot} \approx 9.96 \times 10^{41} \text{ kg}$.

The effective galaxy radius expands as merger material disperses:

$$r(t) = r_0 + v_r t, \quad v_r = 10^3 \text{ m/s}$$

3. Hubble Expansion Correction

$$H(z) = H_0 \sqrt{0.3(1+z)^3 + 0.7}$$

with $H_0 = 70 \text{ km/s/Mpc} = 2.269 \times 10^{-18} \text{ s}^{-1}$, $z = 0.005$:

$$H(z = 0.005) \approx 2.274 \times 10^{-18} \text{ s}^{-1}$$

4. Environmental Forces

Tidal force from merger progenitor and Fornax cluster:

$$F_{env} = F_{tidal} + F_{cluster}$$

$$F_{tidal} = \frac{G M_{spiral} M_{\odot}}{d_{spiral}^2} \approx 1.68 \times 10^{-5} \text{ N/kg}$$

$$F_{cluster} = k_{cluster} \cdot M_{cluster} M_{\odot} \approx 1.99 \times 10^{18} \text{ N}$$

5. UQFF Potential Terms

$$U_{g1} = I \cdot A \cdot \omega_{spin} \cdot B_{AGN}, \quad I = 10^{22} \text{ A}, \quad A = 10^{16} \text{ m}^2$$

$$U_{g2} = \frac{(\mu_0 H_{aether})^2}{2\mu_0} \approx 6.28 \times 10^{-17} \text{ J/m}^3$$

$$U'_{g3} = \frac{G M_{spiral} M_{\odot}}{d_{spiral}^2} \approx 5.56 \times 10^{-19} \text{ m/s}^2$$

$$U_{g4}(t) = k_4 \cdot 10^{46} \cdot e^{-\kappa t}, \quad \kappa = 5 \times 10^{-4} \text{ s}^{-1}$$

$$U_i = \lambda_I \frac{\rho_{SCm}}{\rho_{UA}} \omega_i \cos(\pi t_n) (1 + F_{RZ}) \approx 1.01 \times 10^{-9}$$

6. Dust Lane Quantum Wavefunction

$$\psi_{dust}(r, t) = A e^{-r^2/(2\sigma_{dust}^2)} \cdot e^{i(\theta - \omega t)}$$

$$A = \sqrt{\rho_{dust} \cdot V_{gal}} \approx \sqrt{10^{-21} \cdot 10^{51}} = \sqrt{10^{30}} \approx 10^{15}$$

The quantum pressure term in the metric:

$$\frac{|\psi_{dust}|^2}{\rho_{dust} \cdot V_{gal}} \cdot g_{local} = \frac{\rho_{dust} \cdot V_{gal} \cdot e^{-r^2/\sigma^2}}{\rho_{dust} \cdot V_{gal}} \cdot g_{local} = e^{-r^2/\sigma^2} \cdot g_{local}$$

7. MUGE Master Equation

$$\begin{aligned}
g_{NGC1316}(r, t) = & \frac{G M(t)}{r^2} (1 + H_z) \left(1 - \frac{B_{AGN}}{B_{crit}} \right) (1 + F_{env}) \\
& + (U_{g1} + U_{g2} + U'_{g3} + U_{g4}) + U_i + \frac{\Lambda c^2}{3} \\
& + e^{-r^2/\sigma_{dust}^2} g_{local} + \frac{(M_{vis} + M_{DM}) M_{\odot} \delta\rho/\rho \cdot G}{r^2}
\end{aligned}$$

with $\delta\rho/\rho = 10^{-5}$ dark matter density perturbation.

8. Solved Values (t = 0, r = 46 kpc)

Quantity	Value
$M(0)$	9.96×10^{41} kg
g_{core} at 46 kpc	$\approx 4.66 \times 10^{-10}$ m/s ²
$H(z = 0.005)$ correction	1.2×10^{-5} (negligible)
B_{AGN}/B_{crit}	10^{-15} (negligible)
$\Lambda c^2/3$	$\approx 9.9 \times 10^{-36}$ m/s ²
$U_{g4}(0)$	10^{46}
U_i	$\approx 1.01 \times 10^{-9}$

9. C++ Implementation

The standalone module NGC_1316.cpp (tag STANDALONE_NGC1316) implements: - M_t(t), r_t(t), H_tz(z), F_env(t) - U_g1(t) through U_g4(t), U_i(t) - psi_integral(r, t), g_NGC1316(r, t) - simulate() — 5-step self-expanding simulation - main() — radial profile 10-100 kpc at t = 100 Myr
