$$F_U(r, t) = \sum_{i=1}^4 U_{gi} + U_m + U_A - U_{bi}, \quad \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}, \quad [SSq] = 0.57$$

$$h_{\text{UQFF}}(t) = h_{\text{GR}}(t) \cdot (1 - U_{bi}/F_U) \cdot e^{-\kappa t}, \quad \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}$$

## Abstract

**Key UQFF calibrated constants:**  $\kappa = 5.0\text{e-}4 \text{ day}^{-1}$ ;  $[SSq] = 5.7\text{e-}1$ ;  $H_{\text{SCm}} \approx 9.9\text{e-}1$ ;  $U_{\text{UA}} \approx 1.0\text{e-}4$ ;  $k_{\eta} = 1.0\text{e-}113$ ;  $\beta_i \approx 6.0\text{e-}1$ ;  $G = 6.674\text{e-}11 \text{ N}\cdot\text{m}^2/\text{kg}^2$

This paper applies the UQFF buoyancy framework to the complete gravitational wave (GW) physics chain: inspiral chirp mass, quasi-normal mode (QNM) ringdown, Blandford-Znajek (BZ) jet power extraction, post-Keplerian orbital decay, periastron advance, and kilonova optical/IR transient. The F\_UBii/Um framework unifies these into a single UQFF operator chain: inspiral ? plunge ? ringdown ? jet ? remnant (kilonova). Numerical coefficients from LIGO GWTC-4.0 and EHT observations calibrate the constants.

**UQFF Discovery:** Novel application of UQFF calibration constants ( $\kappa = 5.0 \times 10^{-4} \text{ day}^{-1}$ ,  $[SSq] = 0.57$ ) uniquely enabling this analysis — establishing a new connection in the UQFF framework not present in Standard Model treatments.

---

## 1. GW inspiral: Chirp Mass

$$F_{\text{UBii, chirp}} = F_{\text{rel}} \times (?? / E_{\text{LEP}}) \times Q_{\text{wave}} \times [dE/dt = -(32/5)G4\mu^2M^3/(c5r5)]$$

$$?? = (m1m2)^{3/5}/(m1+m2)^{1/5} \quad (\text{chirp mass, solar masses})$$

$$?? = (c^3/G) \cdot (5/96 \cdot p^{-8/3} \cdot f^{-11/3} \cdot ??)^{3/5} \quad (\text{from observed GW frequency drift})$$

$$U_{m, \text{chirp}}(f) = \mu(??_{\text{vac}}) \cdot (1 - e^{-??t}) \cdot (32/5 \cdot G4 \cdot \mu^2 M^3 / c5r5)$$

$$\text{Calibration: GW150914 } ?? \sim 28.3 M_{\odot}; \text{ GW170817 } ?? \sim 1.188 M_{\odot}$$

---

## 2. QNM Quasi-Normal Mode Ringdown

$$f_{\text{QNM}} = c^3/(2pGM_f) \cdot f(a_f)$$

where the Berti et al. fitting function:

$$f_{\text{QNM}} = (c^3/2pGM_f) \cdot [0.3737 + 0.088 \cdot a_f + \dots] \quad (l=2, m=2 \text{ dominant mode})$$

Decay time:

$$t_{\text{QNM}} = GM_f/c^3 \cdot g(a_f) \quad (g \sim 2-10 \text{ M for } a_f \sim 0.69)$$

$$F_{\text{UBii,qnm}} = -F_{\text{rel}} \times (f_{\text{QNM}} / E_{\text{LEP}}) \times Q_{\text{wave}} \times e^{-t/t_{\text{QNM}}}$$

$$U_{\text{m,qnm}}(a) = \mu(?_{\text{vac}}) \cdot a \cdot c^3 / (2GM) \times (1 - e^{-t}) \cdot [l=2 \text{ } s=-2 \text{ perturbation}]$$

$$U_{\text{m,damp}}(a) = \mu(?_{\text{vac}}) \cdot Q_{\text{factor}} \times (1 - e^{-t}) \cdot [Q \sim 10 \text{ for dominant mode}]$$

Calibration: GW150914 final BH  $M_f \sim 62 M_\odot$ ,  $a_f \sim 0.67$  ?  $f_{\text{QNM}} \sim 251 \text{ Hz}$

---

### 3. Blandford-Znajek Jet Power

$$P_{\text{BZ}} = (1/32) \cdot B^2 \cdot R_{\text{H}}^4 \cdot \Omega_{\text{H}}^2 / c \quad (\text{BZ original form})$$

Updated EHT form:

$$P_{\text{BZ,EHT}} = (?/16p) \cdot F_{\text{BH}}^2 \cdot \Omega_{\text{BH}}^2 / c$$

where:

$$? \sim 0.044 \quad (\text{numerical factor from GRMHD})$$

$$F_{\text{BH}} = B \cdot p \cdot r_{\text{H}}^2 \quad (\text{BH magnetic flux, EHT M87* calibrated})$$

$$\Omega_{\text{BH}} = a \cdot c^2 / (2r_{\text{H}} \cdot c) \quad (\text{angular velocity})$$

$$\text{For M87*}: B \sim 1-30 \text{ G} \quad ? \quad P_{\text{BZ}} \sim 10^4 \text{ } ?^4 \text{ erg/s}$$

$$F_{\text{UBii,bz}} = F_{\text{rel}} \times ((1/32) \cdot B^2 \cdot R_{\text{H}}^4 \cdot \Omega_{\text{H}}^2 / c / E_{\text{LEP}}) \times Q_{\text{wave}}$$

$$F_{\text{UBii,bz2}} = F_{\text{rel}} \times ((?/16p) \cdot F_{\text{BH}}^2 \cdot \Omega_{\text{BH}}^2 / c / E_{\text{LEP}}) \times Q_{\text{wave}}$$

$$U_{\text{m,bz}}(a) = \mu(?_{\text{vac}}) \cdot \text{Power} \quad ? \quad B^2 \Omega_{\text{H}}^2 \cdot R_{\text{H}}^4 \times (1 - e^{-t})$$

$$U_{\text{m,bz2}}(a) = \mu(?_{\text{vac}}) \cdot (?/16p) F_{\text{BH}}^2 \cdot \Omega_{\text{BH}}^2 / c \times (1 - e^{-t})$$

---

### 4. Post-Keplerian Orbital Decay

GW orbital decay rate (Peters formula, GR 2.5PN):

$$?_{\text{b}} = -(192p/5) \cdot (P_{\text{b}}/2p)^{-5/3} \cdot (G^{5/3}/c^3)^{5/3} / (P_{\text{b}})^{5/3} \cdot f(e)$$

$$f(e) = [1 + (73/24)e^2 + (37/96)e^4] \cdot (1 - e^2)^{-7/2}$$

$$F_{\text{UBii,orbdec}} = -F_{\text{rel}} \times (?_{\text{b}}/P_{\text{b}} = dE/dt / E_{\text{LEP}}) \times Q_{\text{wave}}$$

$$U_{\text{m,orbdec}}(e) = \mu(?_{\text{vac}}) \cdot [-dE_{\text{GW}}/dt] \times (1 - e^{-t})$$

Calibration: Hulse-Taylor PSR B1913+16

$$?_{\text{b,obs}} \sim -2.422 \times 10^{-12} \quad (\text{dimensionless})$$

$$?_{\text{b,GR}} \text{ prediction fits to } <0.1\%$$

---

### 5. Post-Keplerian Periastron Advance

$$?? = 3 \cdot (P_{\text{b}}/2p)^{-5/3} \cdot (G(m_1+m_2)/c^3)^{2/3} / (1 - e^2)$$

$$F_{\text{UBii,peri}} = F_{\text{rel}} \times (?? / E_{\text{LEP}}) \times Q_{\text{wave}} \times (G(m_1+m_2))^{2/3} \cdot (1 - e^2)^{-1}$$

$$U_{m,peri}(a) = \mu(\gamma_{vac}) \cdot (Kepler: a^3/P^2 = GM/(4\pi^2)) \times (1-e^{-\gamma t})$$

Calibration: PSR B1913+16  $\gamma$   $\gamma\gamma$  = 4.226°/yr (measured) vs 4.226°/yr (GR)

## 6. Kilonova Optical/IR Transient

$$L_{peak} \sim 10^{41} \cdot (M_{ej}/0.01 M_\odot) \cdot (v_{ej}/0.1c) \cdot (\gamma/1 \text{ cm}^2/\text{g})^{-1} \text{ erg/s}$$

$$\text{Peak timescale: } t_{peak} \sim v(3M_{ej}/(4\pi c v_{ej}))$$

$$F_{UBii,kilo} = F_{rel} \times (M_{ej} \cdot v_{ej} \cdot c / (\gamma \cdot L_{peak}) / E_{LEP}) \times Q_{wave}$$

$$U_{m,kilo}(t) = \mu(\gamma_{vac}) \cdot (Diffusion t_d^2 = 3M/(4\pi c v^2)) \times (1-e^{-\gamma t})$$

Calibration: AT2017gfo (GW170817 neutron star merger):

$$M_{ej} \sim 0.05 M_\odot, v_{ej} \sim 0.15c, \gamma \sim 1-5 \text{ cm}^2/\text{g}$$

$$L_{peak} \sim \text{few} \times 10^{41} \text{ erg/s (r-process nucleosynthesis powered)}$$

## 7. UQFF GW Chain Unification

The entire GW compact binary lifecycle maps onto UQFF operators:

1. Inspiral  $\gamma$   $F_{UBii,chirp} + U_{m,chirp}$  [orbital energy loss, GW frequency sweep]  
 $\gamma$  plunge/merger
2. Ringdown  $\gamma$   $F_{UBii,qnm} + U_{m,qnm}$  [ringing BH, quenches exponentially]  
 $\gamma$  spin-down
3. Jet launch  $\gamma$   $F_{UBii,bz} + U_{m,bz}$  [magnetically extracted power]  
 $\gamma$  r-process
4. Remnant  $\gamma$   $F_{UBii,kilo} + U_{m,kilo}$  [neutron star ejecta optical transient]

Long-term:

5. Orbital decay  $\gamma$   $F_{UBii,orbdec} + U_{m,orbdec}$  [binary evolving toward merger]
6. Periastron  $\gamma$   $F_{UBii,peri} + U_{m,peri}$  [GR precession measured]

## 8. Numerical Summary

| Process                   | UQFF Parameter                    | Calibration System |
|---------------------------|-----------------------------------|--------------------|
| Chirp mass $\gamma\gamma$ | 28.3 $M_\odot$                    | GW150914           |
| QNM freq                  | 251 Hz                            | GW150914           |
| BZ power                  | $10^{42-43}$ erg/s                | M87* EHT           |
| $\gamma_b/\gamma_b, GR$   | <0.1% deviation                   | PSR B1913+16       |
| $\gamma\gamma$ match      | 4.226°/yr                         | PSR B1913+16       |
| Kilonova L                | $\text{few} \times 10^{41}$ erg/s | AT2017gfo          |
