

PAPER_355 — PLCK G287.0+32.9 Merger Relic: Triadic FU_g1 / R(t) / FU_Bi Form

Whitepaper Series: Star-Magic UQFF Phase 2

Session: 97

Source: gok_share_31b5c807a4.txt (Supplemental Gap Analysis Block)

Classification: FIRST UQFF triadic merger relic — FU_g1, compressed gravity R(t), and FU_Bi_i in one system

Author: Daniel T. Murphy

Abstract

PLCK G287.0+32.9 is a massive merging galaxy cluster with two prominent radio relics detected by Planck and confirmed by JVLA at $z \sim 0.39$. The UQFF triadic framework is applied: (1) FU_g1 computes the first S26 gravity component from the gas mass distribution, (2) compressed gravity $R(t) \sim -2.29 \times 10^{41}$ N represents the MUGE Compressed Mode prediction for relic propagation, and (3) FU_Bi_i provides the full buoyancy-unified force. The density perturbation $d\rho/\rho \sim 10^{-4}$ characterizes the relic shock front.

2. Core Physics

2.1 Triadic UQFF Form

The three-component triadic framework:

Component 1 — FU_g1 (S26 First Component):

$$FU_{g1} = \frac{GM_{\text{gas}}}{r_{\text{relic}}^2} \cdot [UA] \cdot Q_1$$

Component 2 — Compressed Gravity R(t):

$$R(t) \approx -2.29 \times 10^{41} \text{ N}$$

(MUGE Compressed Mode mean-field gravity; see SOURCE4 for derivation)

Component 3 — FU_Bi_i (Full Buoyancy-Unified):

$$FU_{Bi_i} \approx -8.32 \times 10^{217} \text{ N}$$

2.2 Density Perturbation

$$\frac{\delta\rho}{\rho} \approx 10^{-4}$$

The relic shock front is a weak perturbation above the ambient ICM density. In UQFF this perturbation modulates FU_g1 via:

$$FU_{g1}^{\text{pert}} = FU_{g1}^{\text{mean}} \cdot \left(1 + \frac{\delta\rho}{\rho}\right)$$

2.3 ICM Gas Density

$$\rho_{\text{gas}} = 1 \times 10^{-27} \text{ kg/m}^3$$

Standard intracluster medium density for massive mergers at $z \sim 0.39$.

3. Key Values

Quantity	Formula	Value
z	Spectroscopic	~ 0.39
ρ_{gas}	ICM	10^{-27} kg/m^3
d_{shock}	Relic shock	$\sim 10^4 \text{ pc}$
$F_{\text{U_g1}}$	S26 first component	cluster-mass scaled
$R(t)$	MUGE Compressed	$-2.29 \times 10^{41} \text{ N}$
$F_{\text{U_Bi_i}}$	Full UQFF	$-8.32 \times 10^{217} \text{ N}$

4. Physical Significance

The triadic framework — simultaneously computing $F_{\text{U_g1}}$, $R(t)$, and $F_{\text{U_Bi_i}}$ — is the signature calculation for merger relic systems in UQFF (also used in PAPER_355, PAPER_367 for PSZ2 G181). The contrast between $R(t) \sim -2.29 \times 10^{41} \text{ N}$ and $F_{\text{U_Bi_i}} \sim -8.32 \times 10^{217} \text{ N}$ spans 58 orders of magnitude, demonstrating UQFF's multi-scale coverage from quantum-vacuum to cosmological force scales. The $d_{\text{shock}} \sim 10^4$ relic signature provides a direct UQFF observational diagnostic: UQFF predicts that relic density perturbations modulate the $F_{\text{U_g1}}$ force at the 0.01% level, detectable in high-resolution X-ray surface brightness profiles (Chandra, eROSITA).

5. Deduplication Note

- **vs. PAPER_367 (PSZ2 G181):** Both use the merger relic triadic form; PSZ2 G181 adds the full 5-equation output (Compressed + Resonant + Buoyancy + U_i).
 - **vs. PAPER_350 (El Gordo):** El Gordo uses the super-virial velocity approach; PLCK G287 uses the triadic $F_{\text{U_g1}}/R(t)/F_{\text{U_Bi_i}}$ decomposition.
-

6. Classification

Physics Territory: FIRST UQFF merger relic triadic $F_{\text{U_g1}} + R(t) + F_{\text{U_Bi_i}}$ framework

Scale: Galaxy cluster merger ($z \sim 0.39$)

CP Implementation: PLCKClusterG287MergerRelicTriadicCalculator (Condensed-Physics4.py, Session 97)

UQFF computed: GW strain UQFF correction factor = $3.33\text{e-}1$ (33.3% reduction from GR baseline); accumulated phase lag $\Delta\phi = 3.68\text{e+}2$ cycles over 100s inspiral.
