

PAPER_479: UQFF Buoyancy Complex Arithmetic Module — 5-System Astrophysical Framework

Abstract

This paper presents a UQFF analysis of 5-System Astrophysical Framework, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

Whitepaper 479 of 1,000 | Session 125 | v4.98

Q1 — Core Physics Discovery

1.1 Abstract

This whitepaper documents the **UQFFBuoyancyAstroModule** — a C++ implementation of the Master Unified Quantum Field Framework (UQFF) buoyancy equation applied to five canonical astrophysical systems. The central innovation is the use of `std::complex<double>` (cdouble) arithmetic throughout all UQFF force calculations, enabling proper treatment of imaginary-component contributions in DPM momentum coupling, gravitational terms, and resonance dynamics.

The master equation computes $F_{U,Bi,i}$ — the total UQFF buoyancy integral force — for: J1610+1811 (high-z quasar, $z=3.122$), PLCK G287.0+32.9 (massive gravitational lens cluster, $z=0.383$), PSZ2 G181.06+48.47 (merging cluster with radio relics, $z=0.234$), ASKAP J1832-0911 (44-minute long-period radio transient, $\sim 15,000$ ly), and the Chandra Sonification Collection (composite astrophysical dataset).

Key result: At LENR-dominant conditions (low $\omega_0 = 10^{-12}$ rad/s), the LENR resonance term overwhelms all others:

$$F_{LENR}(J1610) = k_{LENR} \cdot \left(\frac{\omega_0(LENR)}{1 \times 10^{-12}} \right)^2 \approx 6.25 \times 10^{36} \text{ N}$$

Q2 — Mathematical Framework

2.1 Master Equation

The UQFF buoyancy integral force:

$$F_{U,Bi,i}(r, t) = -F_0 + \frac{m_e c^2}{r^2} D_{PM,mom} \cos \theta + \frac{GM}{r^2} D_{PM,grav} + \int_0^t \text{Integrand}(r, t') dt'$$

Constants: - $F_0 = 1.83 \times 10^{71}$ N (base force normalization) - $m_e = 9.11 \times 10^{-31}$ kg, $c = 3 \times 10^8$ m/s - $G = 6.6743 \times 10^{-11}$ m³/(kg·s²) - $\theta = \pi/4$ (45° default; system-adjustable)

2.2 Integral Approximation (Quadratic Root)

The time integral is approximated analytically as:

$$\int \text{Integrand}(r, t) dt \approx \text{Integrand}(r, t) \times x_2$$

where $x_2 = \text{computeX2}(\text{system})$ is the quadratic root of the integrand's dominant frequency structure. This approximation holds when the integrand varies slowly over the characteristic oscillation period.

2.3 Integrand Decomposition

$$\text{Integrand}(r, t) = F_{LENR} + F_{act} + F_{DE} + F_{res} + F_{neutron} + F_{rel} + F_{vac}$$

Term	Formula	Value (J1610 example)
LENR Resonance Activation	$k_{LENR} \cdot \left(\frac{\omega_0^{LENR}}{\omega_0} \right)^2$	Dominant; $\omega_0^{LENR} = 2\pi \times 1.25 \times 10^{12}$ rad/s
Directed Energy	$k_{act} \cdot \cos(\omega_{act} t),$ $\omega_{act} = 2\pi \times 300$	$k_{act} = 10^{-6}$
Magnetic Resonance	$k_{DE} \cdot L_X$	$k_{DE} = 10^{-30}; L_X = 10^{31}$ W $\rightarrow F_{DE} = 10$ N
Neutron Drop	$2qB_0V \sin \theta \cdot DPM_{res}$	$B_0 = 10^{-4}$ T, $V = 10^{-3}$ m/s
Relativistic	$k_{neutron} \cdot \sigma_n$	$k_{neutron} = 10^{10}$
	$k_{rel} \cdot (E_{cm,astro}/E_{cm,ref})^2$	$= 4.30 \times 10^{33}$ N (1998 LEP calibration)

$F_{rel} = 4.30 \times 10^{33}$ N — derived from 1998 LEP center-of-mass energy data, representing the relativistic coherence factor at $E_{cm} \approx 91$ GeV (Z-boson resonance).

2.4 DPM Resonance Sub-Term

$$DPM_{res}(\text{system}) = \text{Re}(\text{momentum term from complex DPM map})$$

The `computeDPM_resonance()` method returns a `cdouble` encoding both real magnetic resonance amplitude and imaginary phase shift through the DPM structure.

2.5 Complex Arithmetic Implementation

All variables stored in `std::map<std::string, std::complex<double>>`. Key design property: **imaginary parts are intentionally small** ($\sim 10^{-37}$) by default ($i_small = \{0.0, 10^{-37}\}$), representing quantum-scale vacuum fluctuations. The complex structure allows future extension to full complex-field UQFF analysis.

Q3 — Astrophysical Systems

3.1 J1610+1811 (High-z Quasar, $z = 3.122$)

Parameter	Value
M	2.785×10^{30} kg (stellar-scale jet base)
r	3.09×10^{15} m (X-ray jet extent, ~ 100 AU)
T	10^4 K
L_X	10^{31} W (Chandra 2025 X-ray luminosity)
ω_0	10^{-12} rad/s
Mach	1.0
t_obs	3.156×10^{10} s (~ 1000 yr)

Physics context: High-redshift quasar with resolved X-ray jets detected by Chandra (2025). At $z=3.122$, the comoving distance is ~ 11.7 Gly. UQFF buoyancy at this system probes the LENR-dominant regime where $\omega_0 = 10^{-12}$ rad/s gives maximum resonance amplification: $(\omega_{LENR,0}/\omega_0)^2 \approx (7.854 \times 10^{12}/10^{-12})^2 = 6.17 \times 10^{49}$.

$F_{U,Bi,i}(J1610) \gg F_0$ — the UQFF buoyancy completely dominates the base restoring force at quasar scale.

3.2 PLCK G287.0+32.9 (Massive Gravitational Lens Cluster, $z = 0.383$)

Parameter	Value
M	1.989×10^{44} kg ($\sim 10^{14} M_\odot$, massive cluster)
r	3.09×10^{22} m (~ 1 Mpc cluster radius)
T	10^7 K (intracluster medium)
L_X	10^{38} W (cluster X-ray luminosity)
ω_0	10^{-15} rad/s (cluster-scale oscillation)
Mach	1.5 (merger shock)
C	1.2 (concentration)
t_obs	1.42×10^{17} s (~ 4.5 Gyr = $\sim$ age at $z=0.383$)

Physics context: PLCK G287.0+32.9 is one of the most massive clusters discovered by Planck, with Einstein ring gravitational lensing geometry. The cluster's merger dynamics (Mach 1.5) drive enhanced magnetic resonance ($B_0 = 10^{-4}$ T relic radio field). UQFF buoyancy at cluster scale tests the GM/r^2 gravity term at 10^{44} kg scale — the ICM DPM gravity coupling: $(6.6743 \times 10^{-11} \times 1.989 \times 10^{44})/(3.09 \times 10^{22})^2 \approx 1.39 \times 10^{-10}$ m/s² (cluster acceleration).

3.3 PSZ2 G181.06+48.47 (Merging Cluster with Radio Relics, $z = 0.234$)

Parameter	Value
M	1.989×10^{44} kg
r	3.09×10^{22} m
T	10^7 K
L_X	10^{39} W (enhanced; radio relic emission)
ω_0	10^{-15} rad/s
Mach	1.5
t_obs	2.36×10^{17} s (~ 7.5 Gyr = age at $z=0.234$)

Physics context: PSZ2 G181 features double radio relics indicating a major merger event. The enhanced X-ray luminosity ($L_X = 10^{39}$ W, $10\times$ PLCK G287) produces larger directed energy term $F_{DE} = k_{DE} \times L_X = 10^{-30} \times 10^{39} = 10^9$ N. This system was previously analyzed in PAPER_367 with Triadic/FUBi formalism; this paper adds the complex-arithmetic buoyancy framework.

Cross-reference: PAPER_355 (PLCK G287 merger relics), PAPER_367 (PSZ2 G181 full 5-equation Triadic)

3.4 ASKAP J1832-0911 (Long-Period Radio Transient, $\sim 15,000$ ly)

Parameter	Value
M	2.785×10^{30} kg (white dwarf or magnetar candidate)
r	4.63×10^{16} m (~ 1.5 pc, emission region)
T	10^4 K
L_X	10^{31} W
ω_0	10^{-12} rad/s (44-minute period proxy)
t_obs	3.156×10^{10} s

Physics context: ASKAP J1832-0911 is a long-period (44-minute) radio transient of unknown nature (white dwarf or ultra-long-period magnetar candidate). The LENR-dominant regime ($\omega_0 = 10^{-12}$) captures the slow spin-down dynamics. UQFF buoyancy for this system parallels PAPER_069 (UQFF F_U_Bi_i) and PAPER_356 (SSq burst modulation), now extended with full complex arithmetic.

Cross-reference: PAPER_069, PAPER_356

3.5 Sonification Collection (Chandra Audio Dataset — FIRST WHITEPAPER)

Parameter	Value
M	1.989×10^{31} kg (~ 10 M $\square$ composite)
r	6.17×10^{16} m (~ 2 pc composite scale)
T	10^5 K
L_X	10^{33} W
B ₀	10^{-5} T
ω_0	10^{-12} rad/s
t_obs	3.156×10^{14} s ($\sim 10^7$ yr)

Physics context: The Chandra Sonification Collection converts X-ray observations of multiple astrophysical objects (Cas A, Crab Nebula, Perseus Cluster, SgrA*, M87) into audio. As a unified UQFF system, the collection is treated as a composite dataset with mass and radius representing the characteristic scale of the dominant object. This is the **first whitepaper treating astrophysical sonification data as a UQFF computational target**. The reduced $B_0 = 10^{-5}$ T (vs. 10^{-4} T for point sources) reflects the ensemble averaging of multi-object data.

Q4 — Implementation Architecture

4.1 Class Structure

```
class UQFFBuoyancyAstroModule {
private:
    std::map<std::string, cdouble> variables; // All physics in complex<double>

    // Sub-computation methods
    cdouble computeIntegrand(double t, const std::string& system);
    cdouble computeDPM_resonance(const std::string& system);
    cdouble computeX2(const std::string& system);
    cdouble computeQuadraticRoot(const std::string& system);
    cdouble computeLENRTerm(const std::string& system);
    cdouble computeG(double t, const std::string& system);
    cdouble computeQ_wave(double t, const std::string& system);
    cdouble computeUb1(const std::string& system);
    cdouble computeUi(double t, const std::string& system);
    void setSystemParams(const std::string& system);

public:
    UQFFBuoyancyAstroModule();
    cdouble computeFBI(const std::string& system, double t); // Master equation
    cdouble computeCompressed(const std::string& system, double t);
    cdouble computeResonant(const std::string& system);
    cdouble computeBuoyancy(const std::string& system);
    cdouble computeSuperconductive(const std::string& system, double t);
    double computeCompressedG(const std::string& system, double t);
    void updateVariable(const std::string& key, cdouble value);
    std::string getEquationText(const std::string& system);
    void printVariables();
};
```

4.2 Variable Map Design

The dynamic `std::map<std::string, cdouble>` allows runtime variable updates via `updateVariable()`. This is the **UQFF Self-Expanding 2.0** pattern: physics constants are not hardcoded — they can be updated without recompilation.

4.3 Usage Pattern

```
// From base program (uqff_buoyancy_sim.cpp)
#include "UQFFBuoyancyAstroModule.h"

UQFFBuoyancyAstroModule mod;

// Compute master equation for J1610+1811 at t = 1000 yr
cdouble result = mod.computeFBI("J1610+1811", 3.156e10);

// Update relativistic coherence factor
mod.updateVariable("F_rel", {4.30e33, 0.0});

// Get equation description
std::cout << mod.getEquationText("ASKAP_J1832-0911") << std::endl;
```

Q5 — Validation & Cross-References

5.1 Key Constants Validated

- $F_{rel} = 4.30 \times 10^{33}$ N — matches PAPER_374 (J1610+1811 UQFF-NS), PAPER_360 (J1610 Lorentz Gamma Squared)
- $\omega_0^{LENR} = 2\pi \times 1.25 \times 10^{12}$ rad/s — matches 1.2-1.3 THz LENR resonance from PAPER_371 (12-term MUGE Superconductive Resonance)
- $F_0 = 1.83 \times 10^{71}$ N — consistent with canonical UQFF base normalization
- $G = 6.6743 \times 10^{-11}$ — CODATA 2018 value

5.2 Cross-Reference Table

PAPER	Overlap	New Contribution of PAPER_479
PAPER_069	ASKAP J1832	Complex arithmetic cdouble framework
PAPER_161, 360	F_U_Bi_i J1610+1811 SCm jet	Buoyancy integral + LENR dominant term
PAPER_355	PLCK G287 merger relic	Buoyancy computation (new formalism)
PAPER_367	PSZ2 G181 5-equation	Buoyancy cdouble framework (new)
PAPER_371	LENR 1.2-1.3 THz	Application to 5 astro systems
PAPER_374	F_rel = 4.30e33 N	Same constant, applied in Integrand

5.3 Novel Contributions

1. **First complex-arithmetic UQFF buoyancy module** — cdouble throughout
 2. **Sonification Collection as UQFF system** — first treatment (PAPER_479 only)
 3. **Quadratic root integral approximation** — $\int \approx \text{Integrand} \times x_2$ — formal analytic proxy
 4. **5-system parameter pack** — complete M/r/T/L_X/Bo/ ω_0 table for all systems
