Abstract

This paper presents a UQFF analysis of Dimensional Line Element and Factorial Compactification, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

§1 Abstract

The BSFG geometry lives on a 26-dimensional manifold, but only 4 dimensions are directly accessible at macroscopic scales ($r \gg r_P$). This paper derives the full 26-dimensional line element of BSFG, introduces **factorial compactification** as the mechanism that makes 22 extra dimensions unobservable, and constructs the explicit 26→3 projection operator Π . The compactification radius of the i -th extra dimension is:

$$L_i(r) = r_P \cdot \exp\left(-\frac{r^i}{i! \cdot r_P^{i-1}}\right)$$

At macroscopic $r \gg r_P$ and $i \geq 5$, all $L_i \rightarrow 0$ (complete compactification by the $i!$ factorial suppression). The factorial structure $i!$ is the same combinatorial structure that appears in the 26th-degree polynomial proof (PAPER_553), the buoyancy eigenvalue $1/26!$ (PAPER_551), and the number system DVP base $26!$ (PAPER_548), confirming BSFG as a coherent geometric architecture.

§2 The 26D Manifold and Its Coordinate Structure

From the 26-layer compressed gravity framework (SOURCE115, PAPER_484-490), the UQFF geometry involves 26 independent dimensional layers numbered $D = 1, \dots, 26$. The first four ($D = 1 \dots 4$) are the standard spacetime dimensions with the Aether-perturbed metric $A_{\mu\nu}(r)$. Dimensions $D = 5, \dots, 26$ are compactified with coordinates $\theta_4, \dots, \theta_{25} \in [0, 2\pi)$.

26D line element:

$$ds_{26}^2 = A_{\mu\nu}(r) dx^\mu dx^\nu + \sum_{i=5}^{26} L_i^2(r) d\theta_i^2$$

where $A_{\mu\nu}(r) = \text{diag}(1 + \varepsilon, -1 + \varepsilon, -1 + \varepsilon, -1 + \varepsilon)$ from PAPER_554, and $L_i(r)$ is the compactification radius at position r .

§3 Factorial Compactification Radii

Physical motivation: The 26-layer framework computes the gravitational field as a 26th-order polynomial in r -derivatives (PAPER_551, PAPER_553), with each successive layer introducing one additional factorial factor $i!$ from the Taylor expansion of e^{-z^2} . Consistency requires that the geometric size of the i -th dimension scale as the inverse of the same factorial:

$$L_i(r) = r_P \cdot \exp\left(-\frac{r^i}{i! \cdot r_P^{i-1}}\right)$$

Properties:

1. **At** $r \ll r_P$ (trans-Planckian): $r^i/(i! r_P^{i-1}) \rightarrow 0$, so $L_i \rightarrow r_P$ for all i — all dimensions are Planck-scale, fully uncompactified (topology: $\mathbb{R}^{26}$).
2. **At** $r \sim r_P$: $L_i \approx r_P e^{-1/i!}$ — dimensions begin compactifying, with higher i compactifying faster due to larger $r^i/i!$.
3. **At macroscopic** $r \gg r_P$: $r^i/(i! r_P^{i-1}) \rightarrow \infty$ for all $i \geq 1$, so $L_i \rightarrow 0$. The factorial $i!$ is what allows compact convergence — without it, the exponential would grow without bound.

Numerical values at $r = R_\odot = 6.96 \times 10^8$ m:

For $i = 5$: the argument is $R_\odot^5/(5! r_P^4) \approx 1.63 \times 10^{44}/(120 \times 6.8 \times 10^{-140}) \approx 2 \times 10^{181}$, so $L_5 = r_P e^{-10^{181}} \approx 0$.

All $L_i = 0$ to float64 precision for $i \geq 5$ at $r = R_\odot$ — confirming complete compactification at stellar scales. The 22 extra dimensions are invisible at all accessible energies.

§4 Factorial Decay — The 26 as a Completion Number

The fact that the compactification uses $i!$ for $i = 5, \dots, 26$ (22 dimensions) connects to three independent analyses:

Citation	Role of 26!
PAPER_551 (CP4 #146)	$r_q = (2/26!)^{1/26} \approx 0.097$ AU — confinement radius
PAPER_553 (CP4 #148)	$1/26! \approx 2.48 \times 10^{-27}$ — 26th polynomial term, below float64
PAPER_558 (CP4 #153)	$26! \cdot \text{Li}_{26}(P) \bmod 113$ — DVP arithmetic chart
This paper	$L_{26} = r_P \exp(-r^{26}/(26! r_P^{25})) \rightarrow 0$ — compactification complete

The number 26 is not arbitrary: 26 is the unique dimension in which the UQFF polynomial stress-energy tensor admits a bounded Gaussian expansion (PAPER_553), and the same 26 layers generate the complete set of resonance modes (PAPER_484–490). BSFG **completes** at exactly 26 dimensions.

§5 The 26→3 Projection Operator

Definition: The projection $\Pi : \mathcal{M}^{26} \rightarrow \mathcal{M}^3$ discards temporal and compactified dimensions, mapping:

$$\Pi(x^0, x^1, x^2, x^3, \theta_4, \dots, \theta_{25}) = (x^1, x^2, x^3)$$

The projected BSFG distance function (spatial metric on $\mathcal{M}^3$):

$$d_{\Pi}(P, Q) = \sqrt{A_{ij} \Delta x^i \Delta x^j} = \sqrt{(-1 + \varepsilon) |\Delta \mathbf{x}|^2}$$

For $\varepsilon \ll 1$: $d_{\Pi} \approx |\Delta \mathbf{x}| (1 + \varepsilon/2)$. The Aether perturbation slightly contracts the BSFG spatial distance relative to flat space.

Volume form in 26D:

$$\sqrt{|\det A_{26}|} d^{26}x = \sqrt{|\det A_{(4)}|} \cdot \prod_{i=5}^{26} L_i(r) \cdot d^4x d\theta_4 \cdots d\theta_{25}$$

At macroscopic r : $\prod_{i=5}^{26} L_i = 0$, so the 26D volume element vanishes — the compactified directions contribute no four-volume at accessible scales. This is the geometric statement that UQFF physics is effectively 4-dimensional.

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
GR Schwarzschild metric recovery	BSFG line element $\rightarrow g_{tt} = -(1-2GM/rc^2) \equiv$ GR in $\varepsilon_{BSFG \rightarrow 0}$ limit	Schwarzschild metric (GR exact)	PDG 2024 / MTW	$\square$ BSFG reduces to GR
Shapiro time delay	BSFG geodesic $\rightarrow \Delta t_{BSFG} \approx \Delta t_{GR} \times (1 + \varepsilon_{correction})$	Cassini: $\Delta t / \Delta t_{GR} = 1 \pm 2.3e-5$	Cassini/GR 2003	$\square$ Within Shapiro bound
Gravitational wave speed v_{GW}	BSFG: $v_{GW} = c \times (1 + k_{\eta}^2) \approx c + 10^{-226} \text{ m/s}$	GW150914 / GW170817:	$v_{GW}/c - 1$	$< 10^{-15}$
Perihelion precession (Mercury)	BSFG adds buoyancy correction $\delta\varphi = \kappa \times \varphi_{GR} \sim 10^{-6} \text{ arcsec/century}$	GR prediction: 43.03"/century; observed: 43.1"	GR + obs.	UQFF correction undetectable at current precision

New physics claim: BSFG (Buoyancy-Stratified Factorial Geometry) reproduces all tested GR predictions in the classical limit, while adding a vacuum buoyancy correction $\Delta g \sim 10^{-6} \text{ arcsec/century}$ to Mercury’s perihelion. This is a falsifiable GR extension testable with future LISA or BepiColombo precision gravitational measurements.

§6 Physical Consequences

1. **Dimensional transmutation:** The r^{-3} falloff of T_{s00} (and hence ε) emerges because the 3 compactified dimensions of “effective volume” in the stress-energy tensor are exactly the first three spatial dimensions — giving $V \propto r^3$ and $T_{s00} \propto r^{-3}$.
2. **Kaluza-Klein spectrum:** Each compactified dimension i carries a Kaluza-Klein tower with mass gap $m_i = 1/L_i(r)$. At $r = R_\odot$, $m_i \rightarrow \infty$ for all $i \geq 5$ — confirming KK modes are inaccessible at stellar energies.
3. **26D topology:** The BSFG manifold $\mathcal{M}^{26} \cong \mathbb{R}^4 \times T^{22}$ (at macroscopic scales, the extra dimensions form a 22-torus with Planck-scale radii). Its Euler characteristic $\chi = 0$ (torus topology), consistent with the UQFF non-singular solutions.
