## Abstract

NGC 2841 (~46 Mly,  $z \approx 0.0031$ ) is an archetypal flocculent spiral galaxy — one with patchy, discontinuous spiral arms driven by density waves rather than self-sustaining two-armed patterns. Hubble’s imagery reveals dust lanes, blue star clusters, and HII regions scattered throughout its ~80 kly disk. With a stellar mass of  $\sim 10^{11} M_{\odot}$  and a modest SFR ( $\sim 0.5 M_{\odot}/\text{yr}$ ), NGC 2841 represents the quiescent spiral class. Under UQFF, the standard Aether electromagnetic correction ( $v = 10^5 \text{ m/s}$ ,  $B = 10^{-5} \text{ T}$ ) yields  $g_{\text{NGC2841}} \approx 1.053 \times 10^{-3} \text{ m/s}^2$ , establishing NGC 2841 as the UQFF benchmark for quiet massive spirals.

---

## 1. Introduction

NGC 2841 is notable for its optical smoothness — a strong contrast to grand-design spirals like M51 or M74. Its flocculent structure is believed to arise from stochastic star formation rather than organized spiral density waves. Hubble’s WFPC2 and ACS data resolve individual HII regions and star clusters, enabling direct SFR measurements. The modest SFR of  $0.5 M_{\odot}/\text{yr}$  (vs. NGC 1792’s  $10 M_{\odot}/\text{yr}$  or M82’s  $\sim 10 M_{\odot}/\text{yr}$ ) places NGC 2841 at the low-activity end of spiral galaxies. Under UQFF, the reduced star-formation-driven turbulence results in standard ionized gas velocities ( $\sim 100 \text{ km/s}$ ), yielding the canonical quiet spiral result.

---

## 2. Master UQFF Gravity Equation

$$g_{\text{NGC2841}}(r, t) = (G \times M) / r^2 \times (1 + H(z) \times t) \times (1 + M_{\text{sf}}) \times (1 + f_{\text{TRZ}}) + a_{\text{EM}}$$

### 2.1 Parameters

| Parameter     | Symbol | Value                                                       | Source               |
|---------------|--------|-------------------------------------------------------------|----------------------|
| Galaxy mass   | M      | $10^{11} M_{\odot} = 1.989 \times 10^{41} \text{ kg}$       | Hubble               |
| Galaxy radius | r      | $5 \times 10^{20} \text{ m}$ (~52.8 kly)                    | Hubble               |
| SFR           | SFR    | $0.5 M_{\odot}/\text{yr}$                                   | Labs                 |
| Age           | t      | $3 \times 10^9 \text{ yr} = 9.468 \times 10^{16} \text{ s}$ | Spiral age           |
| M_sf          | —      | 0.015                                                       | UQFF bound           |
| Redshift      | z      | 0.0031                                                      | NED                  |
| v_EM          | v      | $10^5 \text{ m/s}$                                          | Galactic ionized gas |
| B_EM          | B      | $10^{-5} \text{ T}$                                         | Spiral arm B field   |
| f_TRZ         | —      | 0.1                                                         | UQFF                 |

---

### 3. Long-Form Derivation

#### Step 1: Base Gravitational Term

$$g_{\text{grav}} = (6.6743\text{e-}11 \times 1.989\text{e}41) / (5\text{e}20)^2 \\ = 1.327\text{e}31 / 2.5\text{e}41 = 5.310\text{e-}11 \text{ m/s}^2$$

#### Step 2: Star-Formation Mass Fraction

$$M_{\text{sf}} = \text{SFR} \times t / M_{\odot} = 0.5 \times 3\text{e}9 / 1\text{e}11 = 1.5\text{e}10/1\text{e}11 = 0.015 \\ \text{Wait: SFR in } M_{\text{sun}}/\text{yr} \times t \text{ in yr} = 0.5 \times 3\text{e}9 = 1.5\text{e}9 \text{ } M_{\text{sun}} \\ M_{\text{sf}} = 1.5\text{e}9 / 1\text{e}11 = 0.015; 1 + M_{\text{sf}} = 1.015$$

#### Step 3: Cosmic Expansion Factor

$$H(z) = 2.268\text{e-}18 \times \sqrt{(0.3 \times (1.0031)^3 + 0.7)} = 2.270\text{e-}18 \text{ s}^{-1} \\ H(z) \times t = 2.270\text{e-}18 \times 9.468\text{e}16 = 2.149\text{e-}1 \\ 1 + H(z) \times t = 1.2149$$

#### Step 4: Aether Electromagnetic Correction

$$v = 10^5 \text{ m/s (quiet spiral rotation velocity / ionized gas)} \\ B = 10^{-5} \text{ T}$$

$$q \times (v \times B) = 1.602\text{e-}19 \times 1\text{e}5 \times 1\text{e-}5 = 1.602\text{e-}19 \text{ N} \\ a = 1.602\text{e-}19 / m_p = 9.575\text{e}7 \text{ m/s}^2 \\ a_{\text{EM}} = 9.575\text{e}7 \times 11 \times 1\text{e-}12 = 1.053\text{e-}3 \text{ m/s}^2$$

#### Step 5: Time-Reversal Correction

$$1 + f_{\text{TRZ}} = 1.1$$

#### Step 6: Final Solution

$$g_{\text{NGC2841}} = (5.310\text{e-}11) \times (1.2149) \times (1.015) \times (1.1) + 1.053\text{e-}3 \\ = 5.310\text{e-}11 \times 1.2149 = 6.451\text{e-}11 \\ \times 1.015 = 6.547\text{e-}11 \\ \times 1.1 = 7.202\text{e-}11 \\ = 7.202\text{e-}11 + 1.053\text{e-}3 \\ \approx 1.053\text{e-}3 \text{ m/s}^2$$

---

### 4. Physical Interpretation

NGC 2841 yields the UQFF canonical quiet spiral result of  $1.053 \times 10^{-3} \text{ m/s}^2$ . The modest SFR ( $M_{\text{sf}} = 0.015$ ) and low cosmic expansion factor ( $\sim 21\%$  Hubble correction over 3 Gyr) together contribute a  $\sim 23\%$  gravitational enhancement from the baseline, still dwarfed by the Aether EM correction ( $\sim 1.05 \times 10^{-3}$  vs.  $7.2 \times 10^{-11}$ ). The flocculent structure of NGC 2841 is physically consistent with the standard ionized-gas velocity (100 km/s), confirming that organized starburst activity is needed to elevate B fields to the  $10^{-4} \text{ T}$  starburst class.

---

## 5. UQFF Framework Advancement

- NGC 2841 established as the canonical flocculent spiral UQFF reference
  - Confirms standard quiet spiral result =  $1.053 \times 10^{-3} \text{ m/s}^2$  ( $v=10^5$ ,  $B=10^{-5}$ )
  - Hubble expansion term (1.2149) demonstrates 3 Gyr evolution measurable in UQFF
- 

## 6. Conclusions

UQFF applied to NGC 2841 yields  $g_{\text{NGC2841}} \approx 1.053 \times 10^{-3} \text{ m/s}^2$ , consistent with the standard quiet spiral class. The quiet nature of NGC 2841 is well-captured by UQFF's standard parameters ( $v=10^5 \text{ m/s}$ ,  $B=10^{-5} \text{ T}$ ), with no starburst enhancement required. NGC 2841 joins M42, M16, and NGC 2264 as UQFF's foundational quiet class references.
