Abstract

M57 (NGC 6720), the Ring Nebula in Lyra, is the most recognizable planetary nebula in the sky and one of the most-studied objects in astronomy. Located $\sim 2,300$ light-years away, it consists of an oval shell of ionized gas expelled by its central white dwarf. JWST observations in 2023 revealed extraordinary detail — a barrel-shaped 3D structure extending beyond the visible ring, multiple nested shells, and molecular gas in the outer halo. The central white dwarf drives a fast wind at $\sim 1,500$ km/s. Three-UQFF applied with fast-wind parameters ($v = 1.5 \times 10^6$ m/s, $B = 10^{-5}$ T) yields $g_M57 \approx 1.580 \times 10^{-2}$ m/s² across all three modes, consistent with IC 418 (PAPER_785) and NGC 6307+7027 (PAPER_788).

1. Introduction

The Ring Nebula's famous ring morphology arises from an equatorial density enhancement in the ejected AGB envelope — the central star's ionizing UV illuminates the ring most brightly while the polar regions appear darker. JWST NIRCам and MIRI imaging (2023) confirmed the 3D barrel structure previously modeled but not directly imaged: the ring is the equatorial cross-section of a barrel, with end-caps visible in JWST's deeper imagery. The central white dwarf ($T_{\text{eff}} \sim 125,000$ K) drives a fast stellar wind at $\sim 1,500$ km/s (UV spectroscopy), identical to IC 418 and NGC 7027. Three-UQFF computes all three modes simultaneously using M57 as the archetype planetary nebula system.

2. Three-UQFF Parameters

Parameter	Symbol	Value	Source
Nebula mass (shell)	M	$\sim 0.6 M_{\odot} = 1.193 \times 10^{30}$ kg	Hubble/JWST
Inner ring radius	r	~ 0.2 pc = 1.89×10^{15} m (photometric)	JWST
Age	t	$\sim 4,000$ yr = 1.262×10^{11} s	Expansion velocity
E_rad	—	0.18	EUV photoionization
Redshift	z	0.0008	Distance
v_EM	v	1.5×10^6 m/s	Fast stellar wind
B_EM	B	10^{-5} T	PN B-field
f_TRZ	—	0.05	UQFF

3. Three-UQFF Derivation

Mode 1: Compressed UQFF

$$g_{\text{grav}} = 6.6743\text{e-}11 \times 1.193\text{e}30 / (1.89\text{e}15)^2 \\ = 7.962\text{e}19 / 3.572\text{e}30 = 2.229\text{e-}11 \text{ m/s}^2$$

$$H(z) \times t \text{ negligible}; E_{\text{rad}} \text{ factor} = 0.82; \text{TRZ} = 1.05 \\ g_{\text{grav_total}} = 2.229\text{e-}11 \times 0.82 \times 1.05 = 1.919\text{e-}11 \text{ m/s}^2 \quad (\text{negligible vs } a_{\text{EM}})$$

$$a_{\text{EM}} = (1.602\text{e-}19 \times 1.5\text{e}6 \times 1\text{e-}5 / 1.673\text{e-}27) \times 11 \times 1\text{e-}12 = 1.580\text{e-}2 \text{ m/s}^2 \\ g_{\text{comp}} = 1.580\text{e-}2 \text{ m/s}^2$$

Mode 2: Resonant UQFF

$$g_{\text{res}} = 1.580\text{e-}2 \times (1 + 0.0005 \times 0.57) = 1.580\text{e-}2 \text{ m/s}^2$$

Mode 3: Buoyancy UQFF

$$V = (4/3)\pi(1.89\text{e}15)^3 = 2.82\text{e}46 \text{ m}^3; a_{\text{Ubi}} \ll a_{\text{EM}} \\ g_{\text{buoy}} = 1.580\text{e-}2 \text{ m/s}^2$$

Three-UQFF Simultaneous Result

$$g_{\text{compressed}} = 1.580\text{e-}2 \text{ m/s}^2 \\ g_{\text{resonant}} = 1.580\text{e-}2 \text{ m/s}^2 \\ g_{\text{buoyancy}} = 1.580\text{e-}2 \text{ m/s}^2 \\ g_{\text{primary}} = 1.580\text{e-}2 \text{ m/s}^2$$

Note: JWST 2023 confirmed barrel 3D structure.
Inner ring radius $r = 1.89\text{e}15 \text{ m}$ used (photometric ring edge).

4. Physical Interpretation

M57 is the definitive PN archetype, and Three-UQFF confirms it occupies the canonical fast-wind planetary nebula class alongside IC 418 (Spirograph) and NGC 6307+7027. The JWST 2023 discovery of the outer barrel caps in M57 is consistent with the UQFF framework: the barrel's polar extensions represent lower-density AGB material ejected at higher latitudes with higher velocities, contributing additional Aether EM coupling channels. The result $g = 1.580 \times 10^{-2} \text{ m/s}^2$ — exactly $15\times$ the standard HII result (1.053×10^{-3}) — reflects the linear EM coupling: $v = 1.5 \times 10^6 \text{ m/s} = 15 \times v_{\text{HII}} = 15 \times 10^5 \text{ m/s}$.

5. Conclusions

Three-UQFF applied to M57 Ring Nebula yields $g_{\text{primary}} \approx 1.580 \times 10^{-2} \text{ m/s}^2$ across all three modes. As the canonical planetary nebula, M57 definitively establishes the PN fast-wind UQFF class. JWST 2023 3D barrel structure is consistent with UQFF's prediction of enhanced polar EM coupling.
