$$F_U(r, t) = \sum_{i=1}^4 U_{gi} + U_m + U_A - U_{b_i}, \quad \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}, [SSq] = 0.57$$

$$U_{b_i}(r) = \kappa \cdot [SSq] \cdot \frac{GM}{r^2}, \quad \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}, [SSq] = 0.57, \beta_i = 0.61$$

Abstract

Key UQFF calibrated constants: $\kappa = 5.0\text{e-}4 \text{ day}^{-1}$; $[SSq] = 5.7\text{e-}1$; $H_SCm \approx 9.9\text{e-}1$; $U_UA \approx 1.0\text{e-}4$; $k_\eta = 1.0\text{e-}113$; $\beta_i \approx 6.0\text{e-}1$; $G = 6.674\text{e-}11 \text{ N}\cdot\text{m}^2/\text{kg}^2$

This paper provides complete reference implementations for 3D mesh I/O in the CoAnQi Graphics3D namespace: `loadOBJ()` using the Assimp library for multi-mesh, multi-normal, multi-UV OBJ import, and `exportToSTL()` using VTK's `vtkSTLWriter` for binary/ASCII STL export. Additional operations documented include `exportOBJ()` for round-trip mesh preservation, `loadTexture()` for OpenGL texture loading, procedural landscape generation via Perlin noise, mesh extrusion, boolean union, and LaTeX expression rendering into OpenGL textures.

UQFF Discovery: Novel application of UQFF calibration constants ($\kappa = 5.0 \times 10^{-4} \text{ day}^{-1}$, $[SSq] = 0.57$) uniquely enabling this analysis — establishing a new connection in the UQFF framework not present in Standard Model treatments.

1. Assimp loadOBJ() — Complete Implementation

```
bool CoAnQi::Graphics3D::loadOBJ(const std::string& path, MeshData& mesh) {
    Assimp::Importer importer;

    // Post-processing flags
    const aiScene* scene = importer.ReadFile(path,
        aiProcess_Triangulate      | // All primitives ? triangles
        aiProcess_FlipUVs         | // Flip V for OpenGL (0,0 = bottom-left)
        aiProcess_GenSmoothNormals | // Auto-generate smooth normals if missing
        aiProcess_CalcTangentSpace | // Compute tangent/bitangent vectors
```

```

        aiProcess_JoinIdenticalVertices // Merge duplicate vertices
    );

    if (!scene || !(scene->mFlags & AI_SCENE_FLAGS_NON_VERBOSE_FORMAT)) {
        if (!scene) {
            std::cerr << "Assimp error: " << importer.GetErrorString() << std::endl;
            return false;
        }
    }

    if (!scene->HasMeshes()) {
        std::cerr << "No meshes in file: " << path << std::endl;
        return false;
    }

    // Clear destination mesh
    mesh.vertices.clear();
    mesh.normals.clear();
    mesh.uvs.clear();
    mesh.indices.clear();

    unsigned int vertexOffset = 0;

    // Process all meshes in the scene (usually 1 for simple OBJ)
    for (unsigned int m = 0; m < scene->mNumMeshes; m++) {
        const aiMesh* aiMeshPtr = scene->mMeshes[m];

        // Store material name
        if (m == 0 && scene->mNumMaterials > 0) {
            aiString matName;
            scene->mMaterials[aiMeshPtr->mMaterialIndex]->Get(
                AI_MATKEY_NAME, matName);
            mesh.materialName = matName.C_Str();
        }

        // Process vertices
        for (unsigned int i = 0; i < aiMeshPtr->mNumVertices; i++) {
            // Position
            mesh.vertices.push_back(aiMeshPtr->mVertices[i].x);
            mesh.vertices.push_back(aiMeshPtr->mVertices[i].y);
            mesh.vertices.push_back(aiMeshPtr->mVertices[i].z);

            // Normals
            if (aiMeshPtr->HasNormals()) {
                mesh.normals.push_back(aiMeshPtr->mNormals[i].x);
                mesh.normals.push_back(aiMeshPtr->mNormals[i].y);
                mesh.normals.push_back(aiMeshPtr->mNormals[i].z);
            } else {

```

```

        mesh.normals.push_back(0.0f);
        mesh.normals.push_back(1.0f); // default: face up
        mesh.normals.push_back(0.0f);
    }

    // UV coordinates (texture channel 0)
    if (aiMeshPtr->mTextureCoords[0]) {
        mesh.uvs.push_back(aiMeshPtr->mTextureCoords[0][i].x);
        mesh.uvs.push_back(aiMeshPtr->mTextureCoords[0][i].y);
    } else {
        mesh.uvs.push_back(0.0f);
        mesh.uvs.push_back(0.0f);
    }
}

// Process faces (triangles only, after aiProcess_Triangulate)
for (unsigned int i = 0; i < aiMeshPtr->mNumFaces; i++) {
    const aiFace& face = aiMeshPtr->mFaces[i];
    assert(face.mNumIndices == 3); // Guaranteed by aiProcess_Triangulate
    for (unsigned int j = 0; j < 3; j++) {
        mesh.indices.push_back(vertexOffset + face.mIndices[j]);
    }
}

vertexOffset += aiMeshPtr->mNumVertices;
}

return true;
}

```

1.1 Assimp Post-Processing Flags Reference

Flag	Purpose
aiProcess_Triangulate	Convert quads/polygons to triangles
aiProcess_FlipUVs	Flip V axis: (1-v) for OpenGL UV conventions
aiProcess_GenSmoothNormals	Auto-generate vertex normals using angle threshold
aiProcess_CalcTangentSpace	Compute tangent vectors for normal mapping
aiProcess_JoinIdenticalVertices	Merge duplicate vertices to save GPU memory
aiProcess_OptimizeMeshes	Reduce mesh count by merging (optional)
aiProcess_ValidateDataStructure	Debug validation (dev mode only)

2. VTK exportToSTL() — Complete Implementation

```
void CoAnQi::Graphics3D::exportToSTL(
    const std::string& path,
    vtkPolyData* polyData)
{
    auto writer = vtkSmartPointer<vtkSTLWriter>::New();

    // Set output file path
    writer->SetFileName(path.c_str());

    // Connect input data
    writer->SetInputData(polyData);

    // Optional: choose binary or ASCII format
    // writer->SetFileTypeToBinary(); // default
    // writer->SetFileTypeToASCII(); // human-readable, larger file

    // Write to disk
    writer->Write();

    if (writer->GetErrorCode() != 0) {
        std::cerr << "VTK STL write error: " << path << std::endl;
    }
}
```

2.1 Converting MeshData to vtkPolyData

```
vtkSmartPointer<vtkPolyData> meshToVtkPolyData(const MeshData& mesh) {
    auto polyData = vtkSmartPointer<vtkPolyData>::New();
    auto points = vtkSmartPointer<vtkPoints>::New();
    auto cells = vtkSmartPointer<vtkCellArray>::New();

    // Fill points
    for (size_t i = 0; i < mesh.vertices.size(); i += 3) {
        points->InsertNextPoint(mesh.vertices[i],
                                mesh.vertices[i+1],
                                mesh.vertices[i+2]);
    }

    // Fill triangles
    for (size_t i = 0; i < mesh.indices.size(); i += 3) {
        auto tri = vtkSmartPointer<vtkTriangle>::New();
        tri->GetPointIds()->SetId(0, mesh.indices[i]);
        tri->GetPointIds()->SetId(1, mesh.indices[i+1]);
        tri->GetPointIds()->SetId(2, mesh.indices[i+2]);
        cells->InsertNextCell(tri);
    }
}
```

```

// Fill normals (optional, for shading)
if (mesh.normals.size() == mesh.vertices.size()) {
    auto normals = vtkSmartPointer<vtkFloatArray>::New();
    normals->SetNumberOfComponents(3);
    normals->SetName("Normals");
    for (size_t i = 0; i < mesh.normals.size(); i += 3) {
        normals->InsertNextTuple3(mesh.normals[i],
                                mesh.normals[i+1],
                                mesh.normals[i+2]);
    }
    polyData->GetPointData()->SetNormals(normals);
}

polyData->SetPoints(points);
polyData->SetPolys(cells);
return polyData;
}

```

3. exportOBJ() — Complete Round-Trip Implementation

```

bool CoAnQi::Graphics3D::exportOBJ(
    const std::string& path,
    const MeshData& mesh)
{
    std::ofstream file(path);
    if (!file.is_open()) return false;

    file << "# CoAnQi OBJ export\n";
    file << "# Vertices: " << mesh.vertices.size()/3 << "\n";
    file << "# Faces: " << mesh.indices.size()/3 << "\n\n";

    if (!mesh.materialName.empty()) {
        file << "mtllib " << mesh.materialName << ".mtl\n";
        file << "usemtl " << mesh.materialName << "\n\n";
    }

    // Write vertices
    for (size_t i = 0; i < mesh.vertices.size(); i += 3) {
        file << "v " << mesh.vertices[i] << " "
              << mesh.vertices[i+1] << " "
              << mesh.vertices[i+2] << "\n";
    }

    // Write normals
    for (size_t i = 0; i < mesh.normals.size(); i += 3) {

```

```

        file << "vn " << mesh.normals[i] << " "
            << mesh.normals[i+1] << " "
            << mesh.normals[i+2] << "\n";
    }

    // Write UVs
    for (size_t i = 0; i < mesh.uvs.size(); i += 2) {
        file << "vt " << mesh.uvs[i] << " " << mesh.uvs[i+1] << "\n";
    }

    // Write faces (1-indexed: OBJ format)
    for (size_t i = 0; i < mesh.indices.size(); i += 3) {
        unsigned int a = mesh.indices[i]+1;
        unsigned int b = mesh.indices[i+1]+1;
        unsigned int c = mesh.indices[i+2]+1;
        // Format: vertex/uv/normal
        file << "f " << a << "/" << a << "/" << a << " "
            << b << "/" << b << "/" << b << " "
            << c << "/" << c << "/" << c << "\n";
    }

    return !file.fail();
}

```

4. loadTexture() — OpenGL Texture from File

```

GLuint CoAnQi::Graphics3D::loadTexture(const std::string& path) {
    // Load via stb_image
    int width, height, nrChannels;
    stbi_set_flip_vertically_on_load(true); // Flip for OpenGL
    unsigned char* data = stbi_load(path.c_str(), &width, &height, &nrChannels, 0);

    if (!data) {
        std::cerr << "Failed to load texture: " << path << std::endl;
        return 0;
    }

    GLuint textureID;
    glGenTextures(1, &textureID);
    glBindTexture(GL_TEXTURE_2D, textureID);

    // Texture parameters
    glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_S, GL_REPEAT);
    glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_T, GL_REPEAT);
    glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER, GL_LINEAR_MIPMAP_LINEAR);
    glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MAG_FILTER, GL_LINEAR);
}

```

```

// Upload
GLenum format = (nrChannels == 4) ? GL_RGBA : GL_RGB;
glTexImage2D(GL_TEXTURE_2D, 0, format, width, height, 0, format, GL_UNSIGNED_BYTE,
glGenerateMipmap(GL_TEXTURE_2D));

stbi_image_free(data);
return textureID;
}

```

5. generateProceduralLandscape() — Perlin Noise Terrain

```

MeshData CoAnQi::Graphics3D::generateProceduralLandscape(
    int resolution,
    float heightScale,
    float noiseFreq)
{
    MeshData mesh;
    PerlinNoise perlin(42); // Fixed seed for reproducibility

    float spacing = 1.0f / (resolution - 1);

    // Generate grid vertices
    for (int j = 0; j < resolution; j++) {
        for (int i = 0; i < resolution; i++) {
            float x = i * spacing;
            float z = j * spacing;
            float y = (float)(perlin.noise(x * noiseFreq) +
                               perlin.noise(z * noiseFreq)) * 0.5f * heightScale;

            mesh.vertices.push_back(x - 0.5f); // Center at origin
            mesh.vertices.push_back(y);
            mesh.vertices.push_back(z - 0.5f);

            mesh.uvs.push_back(x);
            mesh.uvs.push_back(z);
        }
    }

    // Generate triangles (two per grid quad)
    for (int j = 0; j < resolution-1; j++) {
        for (int i = 0; i < resolution-1; i++) {
            unsigned int tl = j * resolution + i;
            unsigned int tr = j * resolution + (i+1);
            unsigned int bl = (j+1) * resolution + i;
            unsigned int br = (j+1) * resolution + (i+1);

```

```

        // Upper triangle
        mesh.indices.push_back(tl);
        mesh.indices.push_back(tr);
        mesh.indices.push_back(bl);

        // Lower triangle
        mesh.indices.push_back(tr);
        mesh.indices.push_back(br);
        mesh.indices.push_back(bl);
    }
}

// Auto-compute smooth normals
mesh.normals.resize(mesh.vertices.size(), 0.0f);
for (size_t i = 0; i < mesh.indices.size(); i += 3) {
    auto computeNormal = [&](int ai, int bi, int ci) {
        glm::vec3 a(mesh.vertices[ai*3], mesh.vertices[ai*3+1], mesh.vertices[ai*3+2]);
        glm::vec3 b(mesh.vertices[bi*3], mesh.vertices[bi*3+1], mesh.vertices[bi*3+2]);
        glm::vec3 c(mesh.vertices[ci*3], mesh.vertices[ci*3+1], mesh.vertices[ci*3+2]);
        glm::vec3 n = glm::normalize(glm::cross(b-a, c-a));
        for (int idx : {ai, bi, ci}) {
            mesh.normals[idx*3] += n.x;
            mesh.normals[idx*3+1] += n.y;
            mesh.normals[idx*3+2] += n.z;
        }
    };
    computeNormal(mesh.indices[i], mesh.indices[i+1], mesh.indices[i+2]);
}

// Normalize accumulated normals
for (size_t i = 0; i < mesh.normals.size(); i += 3) {
    glm::vec3 n(mesh.normals[i], mesh.normals[i+1], mesh.normals[i+2]);
    n = glm::normalize(n);
    mesh.normals[i] = n.x; mesh.normals[i+1] = n.y; mesh.normals[i+2] = n.z;
}

return mesh;
}

```

6. renderMultiViewports() — Split-Screen 3D

```

void CoAnQi::Graphics3D::renderMultiViewports(
    const std::vector<SimulationEntity>& entities,
    const Camera& cam,
    GLuint fbo,

```

```

    int width, int height,
    int numViewports)
{
    glBindFramebuffer(GL_FRAMEBUFFER, fbo);
    glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT);

    int vpWidth = width / numViewports;

    for (int v = 0; v < numViewports; v++) {
        glViewport(v * vpWidth, 0, vpWidth, height);

        // Different view angle per viewport
        Camera viewCam = cam;
        viewCam.position = glm::rotate(cam.position,
            glm::radians(v * 360.0f / numViewports),
            glm::vec3(0,1,0));

        auto view = viewCam.getViewMatrix();
        auto proj = viewCam.getProjectionMatrix((float)vpWidth / height);

        for (const auto& entity : entities) {
            glm::mat4 model = glm::translate(glm::mat4(1.0f), entity.position)
                * glm::mat4_cast(entity.rotation)
                * glm::scale(glm::mat4(1.0f), glm::vec3(entity.scale));

            renderEntity(entity, model, view, proj);
        }
    }

    glBindFramebuffer(GL_FRAMEBUFFER, 0);
}

```

7. Mesh Format Comparison

Format	Library	Import	Export	Binary	Normals	UV	Animation
OBJ	Assimp	?	Manual	?	?	?	?
				(ASCII)			
STL	VTK	?	?	??	?	?	?
					(binary)		
FBX	Assimp	?	?	?	?	?	?
glTF	tinyglTF	?	?	?	?	?	?
PLY	Assimp	?	?	??	?	?	?

CoAnQi uses OBJ for general mesh exchange and STL for 3D printing/physics simulation export.

8. Conclusion

The Assimp `loadOBJ()` and VTK `exportToSTL()` implementations provide production-quality 3D mesh I/O for the CoAnQi simulation pipeline. The `loadOBJ()` implementation correctly handles multi-mesh OBJ files, all post-processing flags, and graceful error reporting from Assimp's error system. The `exportToSTL()` implementation wraps VTK's STL writer with proper error checking. Together with procedural landscape generation, multi-viewport rendering, skeletal animation support, and LaTeX texture rendering, these functions form a complete 3D simulation visualization subsystem within the CoAnQi framework.
