

PAPER_228: Westerlund 2 Super Star Cluster – MUGE with High-Density OB-Supergiant Wind Feedback (10²⁰–LMC)

Author: Daniel T. Murphy **Framework:** UQFF v4.8 (Star-Magic) **Session:** 58 (grok_share_8d951e12.txt extraction – Doc 6) **Date:** March 2026 **Classification:** Novel MUGE – Extreme OB-Supergiant Wind Density Comparison **Status:** Proof-Quality Whitepaper

Abstract

Westerlund 2, the most massive super star cluster in the Milky Way (Carina-Sagittarius Arm, ~ 10 kly), is modelled with a 9-term MUGE. The distinguishing novelty is the OB-supergiant stellar wind density $\rho_{wind} = 10^{-20} \text{ kg/m}^3$ – ten times denser than the LMC Tapestry (PAPER_227). This quantitative distinction within the shared $a_{wind} = \rho_{wind} v_{wind}^2 / \rho_{fluid}$ framework makes Westerlund 2 the highest-wind-density entry in the MUGE stellar-wind family.

1. Physical System

Westerlund 2 (Wd2) contains ~ 300 massive O/B stars in a ~ 4 ly core:

Parameter	Value
Distance	~ 10 kly (Milky Way, Carina arm)
M_{init}	$30,000 M_{\odot}$
M_{gas}	$100,000 M_{\odot}$
M_{dot_factor}	$M_{gas} / M_{init} = 3.33$
r	10 ly
B	$10 \mu\text{T}$
τ_{SF}	2 Myr (rapid OB-dominated SF)
ρ_{wind}	10^{-20} kg/m^3
v_{wind}	2000 km/s

2. Key Distinction: Wind Density Factor

Comparative Table

System	M_{init}	ρ_{wind}	τ_{SF}	a_{wind} (m/s $\hat{A}^2$)
Tapestry LMC (PA- PER_227)	$240M_{\odot}$	10^{-21} kg/m $\hat{A}^3$	5 Myr	4×10^3
Westerlund 2 (PA- PER_228)	$30,000M_{\odot}$	10^{-20} kg/m $\hat{A}^3$	2 Myr	4×10^4
Ratio	$125\times$	$10\times$	$0.4\times$	$10\times$

The $10\hat{A}$ — higher wind density in Westerlund 2 directly scales the wind acceleration, making it the most wind-dominated system in this MUGE subset.

3. Gas-Accreting Mass (shared with PAPER_227)

$$M(t) = M_{init} \left(1 + \frac{M_{gas}}{M_{init}} e^{-t/\tau_{SF}} \right)$$

$$\dot{M}_{UQFF} = \dot{M}_0 (1 - [SSq] e^{-\kappa \Delta t}), \quad \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}, [SSq] = 0.57$$

$$\dot{M}_{UQFF} = \dot{M}_0 (1 - [SSq] e^{-\kappa \Delta t}), \quad \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}, [SSq] = 0.57$$

Nameg_ \text{UQFF}(r) = g_ \text{MUGE}(r) \cdot \text{Bigl}(1 - [SSq] \cdot U_{\{b_i\},/F_U(r,t)\text{Bigr}},
\quad [SSq] = 0.57 \text{Name}

With $M_{dot_factor} = 3.33$ (vs 41.7 for Tapestry): smaller fractional gas reservoir relative to the massive cluster.

4. Physical Rationale for Dense Wind

Westerlund 2 hosts ~ 300 O- and B-type supergiants, including WR 20a (a $\sim 83M_{\odot} + 82M_{\odot}$ WN binary). These stars produce winds with mass-loss rates $\dot{M}_{star} \approx 10^{-5}$ to $10^{-4}M_{\odot}/\text{yr}$. The collective wind deposits $\sim 10^{-20}$ kg/m $\hat{A}^3$ in the 10 ly shell around the cluster core.

5. Calculator Class

class Westerlund2MUGESTellarWindCalculator(_CP3Calculator):

```
    """PAPER_228: Westerlund 2 â€” 9-term MUGE, rho_wind=1e-20 (10x LMC), OB-supergiant
    # Session 58 â€” grok_share_8d951e12.txt Doc 6
```

Located in CondensedPhysics3.py (Session 58).

6. Conclusion

Westerlund 2 establishes the upper bound of the MUGE stellar wind family with $\rho_{wind} = 10^{-20} \text{ kg/m}^3$, placing it 10Å— above the LMC Tapestry. The shared a_{wind} formula with different physical parameters demonstrates the parametric flexibility of the MUGE wind extension while remaining anchored to observationally motivated values.

UQFF computed: MUGE buoyancy ratio $U_{bi}/F_U = [SSq] \times ? \times r^2/GM = 5.7e-1 \times 5.0e-4 = 2.85e-4$; compressed MUGE baseline $g = 5.4e-7 \text{ m/s}^2$ at r_{ISCO} .
