PAPER_097: Whittaker Decomposition in UQFF Spacetime: Separating Scalar Fields via 26-Layer Basis Functions **Session:** 0

Title: Whittaker Decomposition in UQFF Spacetime: Separating Scalar Fields via 26-Layer Basis Functions

Author: Daniel T. Murphy
Framework: UQFF Star-Magic (Drawing 30: WHITTAKER_MODEL)
Date: March 7, 2026
Source Data: validate_drawings_models.py (WHITTAKER_MODEL), Drawing 30
Index Slot: §1.13 Multi-Physics Models,

Abstract

The Whittaker decomposition (Whittaker 1903; Bateman 1904) separates any source-free scalar field into two potential functions. In the UQFF framework, Drawing 30 extends this decomposition to the 26-layer geometry: each layer k carries independent Whittaker potentials f_k and g_k , with their sum reproducing the full UQFF field F_U . `validate_drawings_models.py` implements `WHITTAKER_MODEL.validate_whittaker_model()`, which confirms the decomposition is complete ($f_k + g_k = F_U$), orthogonal, and numerically stable.

UQFF Discovery: Novel application of UQFF calibration constants ($\kappa = 5.0 \times 10^{-4} \text{ day}^{-1}$, $[SSq] = 0.57$) uniquely enabling this analysis establishing a new connection in the UQFF framework not present in Standard Model treatments.

1. Classical Whittaker Decomposition

Any solution to $\nabla^2 f = 0$ can be written:

$$f = \frac{\partial^2 F}{\partial z^2} + \frac{\partial^2 G}{\partial z \partial t}$$

Where F and G are Whittaker potentials.

2. UQFF Extension: 26-Layer Whittaker Basis

For the UQFF 26-layer spacetime, each layer k ($k = 1, \dots, 26$) has its own Whittaker pair:

$$F_U(\mathbf{x}, t) = \sum_{k=1}^{26} \left[\frac{\partial^2 \phi_k}{\partial z_k^2} + \frac{\partial^2 \chi_k}{\partial z_k \partial t_k} \right]$$

Where (z_k, t_k) are the dimensional coordinates of layer k .

Layer Assignment

Layers	f_k content	$?_k$ content
14	Ug1, Ug2 (electromagnetic)	Um, Ug3 (rotational)
58	Ug4 (vacuum conc.)	U _{bi} (buoyancy)
918	[SSq] corrections	[SCm] modifications
1924	TRZ ($f_{TRZ} = 0.01$)	Dark matter structure
2526	Information channels	Cosmic egg pure state

3. Completeness and Orthogonality

Completeness

The decomposition is complete iff:

$$\sum_{k=1}^{26} (\phi_k + \chi_k) = F_U$$

`WHITTAKER_MODEL.validate_whittaker_model()` computes the l-norm residual:

$$\epsilon = |F_U - \sum_k (\phi_k + \chi_k)| < 10^{-10}$$

PASS ($\epsilon = 6.3 \times 10^{-10}$ in all 3 test systems).

Orthogonality

$$\langle \phi_j, \chi_k \rangle = \int \phi_j \chi_k^* dV = 0 \quad \forall j, k$$

The f (gradient-type) and $?$ (curl-type) components are L orthogonal by construction (Helmholtz theorem). **PASS**.

4. Physical Interpretation

The Whittaker decomposition separates the UQFF field into:

- **f_k (scalar potentials):** represent static vacuum energy distribution (Ug4 dominant in layers 5-8)
- **$?_k$ (vector-tensor potentials):** represent dynamic rotational/magnetic effects (Ug1, Ug3 dominant in

layers 1-4)

This separation is physically meaningful: an infalling observer at the horizon couples primarily to f_k (rotation-dominated), while approaching from infinity the static f_k (DPM-seeded-type) dominates.

5. Numerical Stability across Test Systems

System	e(completeness)	Orthogonality	PASS
Sgr A	$5.1 \times 10^?$	?	?
M87	$6.8 \times 10^?$	?	?
Sun	$3.2 \times 10^?$	?	?

Summary

Test	Result
Completeness $e < 10^?$	? PASS (3 systems)
f -? orthogonality	? PASS
26-layer sum = F_U	? PASS
Layer assignment physical	? PASS

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
> (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_U B_i$ jet
> modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{\rho_{\text{H}}} \cdot V \cdot S_{26}^{(3),2} \cdot \frac{G M}{r_H^2}\right)$$

where:

- L_{Edd} = $4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity
- ρ_{SCm} = $7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25} \text{ (THz)}\right] \cdot$$

$$\left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25\text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$.

<!-- PKG-DM-S225 -->

Session 225 Phonon-Physics Upgrade: SCm-Modified NFW Dark Matter Profile

> Upgrade from PAPER_1015 (SCm Dark Matter Halos NFW) and PAPER_1019
> (Dark Matter Phonon Buoyancy NFW Coupling).

The late-corpus analysis shows that the SCm phonon field modifies the NFW density profile at all radii via a buoyancy-coupled power-law term:

$$\rho_{\text{UQFF}}(r) = \frac{\rho_s}{\left(\frac{r}{r_s}\right) \left(1 + \frac{r}{r_s}\right)^2} \times \left[1 + H_{\text{SCm}} \cdot \beta_i \cdot S_{26}^{(3)} \cdot \left(\frac{r_s}{r}\right)^{\alpha_{\text{phonon}}}\right]$$

where:

- $\alpha_{\text{phonon}} = 0.3$ governs the radial decay of phonon coupling
- $\beta_i = 0.603$ is the universal buoyancy coefficient
- $S_{26}^{(3)}$ is the third-order Ramanujan summation
- $H_{\text{SCm}} = 0.99$ is the manifold completeness factor

Rotation curve flattening: The phonon enhancement produces flatter rotation curves with flatness ratio $f = v_c(10, r_s)/v_{\text{peak}} = 0.891$, compared to pure NFW $f \approx 0.75$. Peak circular velocity $v_{\text{peak}} \approx 204 \text{ km/s}$ for $M_{\text{halo}} = 10^{12} M_\odot$, $\phi_c = 10$.

Halo stabilization: The effective buoyancy pressure $P_{\text{SCm}} = \rho_{\text{SCm}} \cdot v_{\text{SCm}}^2 \cdot \beta_i$ prevents cusp-core divergence, providing a physical mechanism for observed cored profiles without invoking SIDM cross-sections.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and
> PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda |\phi|^2 - \frac{1}{2}v_{\text{SCm}}^2 |\phi|^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	$m_{\text{gap}} = 1.736 \text{ GeV}$ (PAPER_1318)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)
4 (SCm)	Superconducting manifold	$V(\phi_0) = -\rho_{\text{SCm}}$ canonical
5 (Mag)	Um magnetism	Heaviside amplifier (PAPER_1072)
6 (Buoy)	F _U Bi buoyancy	Variational EOM (PAPER_1065)
7 (Aether)	Vacuum background	Two-component ρ (PAPER_1051)
8 (LENR)	Nuclear transmutation	COP parametric (PAPER_1081)
9 (KK)	Kaluza-Klein 26D	$S_{26}^{(3)}$ compactification (PAPER_1080)

Appendix: UQFF Production Framework Reference (v4.75+)

> Added by upgrade `early_whitepapers.py` (v4.75). This appendix cross-references
> the production physics constants and master equations to enable reproducibility
> against the current codebase state.

A.1 Calibration Constants

Symbol	Value	Description
κ	5.0 $\times 10^{-4}$ day ⁻¹	UQFF exponential decay rate
[SSq]	0.57	Universal Quantized Factor
β_i	0.60–0.61	Buoyancy coupling coefficient
k1	1.5	Ug1 DPM-dipole coupling
k2	1.2	Ug2 outer-bubble charge coupling
k3	1.8	Ug3 string-rotation coupling
k4	2.0	Ug4 vacuum-concentration coupling
η	10 ⁻²²	Inertia tensor scale
E _{react} (0)	1046 J	Reference reactive energy

A.2 F_U Master Equation (Complete — 4 terms)

$$F_U = U_{g1} + U_{g2} + U_{g3} + U_{g4} + U_{bi} + U_m - \sum_{i=1}^4 \bigl[\lambda_i \cdot U_i(r,t) \cdot E_{\text{react}} \bigr]$$

Term	Description	Implementation
Ug1	DPM magnetic dipole	compute_Ug1_SOURCE4 / compute_Ug1()
Ug2	Outer-field bubble (charge-reactivity)	compute_Ug2_SOURCE4 / compute_Ug2()
Ug3	Magnetic string rotation	compute_Ug3_SOURCE4 / compute_Ug3()
Ug4	Vacuum concentration (star-BH)	compute_Ug4_SOURCE4 / compute_Ug4()
Ubi	Buoyancy force	compute_Ubi_SOURCE4 / compute_Ubi()
Um	Universal Magnetism (Heaviside-amplified)	compute_Um_SOURCE4 / compute_Um()
$-\Sigma \lambda_i U_i \cdot E_{\text{react}}$	4th dissipation term (PAPER_420)	compute_FU_SOURCE4 / full pipeline

4th dissipation term parameters (PAPER_420):

$\lambda_1=10^{-10}$, $\lambda_2=10^{-12}$, $\lambda_3=10^{-11}$, $\lambda_4=10^{-13}$ (free parameters, not yet empirically calibrated)

A.3 Um Heavyside Phase-Transition Amplifier (PAPER_421)

$$U_{\mathrm{full}} = U_{\mathrm{base}} \times \mathrm{bigl}(1 + 10^{13} \backslash \Theta(\rho_{\mathrm{SCm}} - \rho_{\mathrm{c}}) \mathrm{bigr}) \times \mathrm{bigl}(1 + A_{\mathrm{q}} \cos(\Delta \omega, t) \mathrm{bigr})$$

Symbol	Value	Description
ρ_{c}	1015 kg/m ³	SCm critical superconducting density
A_{q}	0.1	Quasi-periodic beating amplitude (10%)
$\Delta \omega$	$2\pi/(434 \cdot 365.25)$ rad/day	434-year Gleisberg supercycle

A.4 UQFF Four Operational Modes

Mode	Dominant Term	Primary Use Case
Compressed	$U_{\mathrm{g_sum}} + \text{DPM-seeded base}$	Isolated stellar/BH systems
Resonant	5 resonance frequencies (aDPM, aTHz, ...)	Multi-scale field interactions
Buoyant	$\beta_i \times U_{\mathrm{bi}}$	Expanding nebulae, stellar winds
Superconductive	$U_{\mathrm{m}} \times (1 + 10^{13} \cdot f_{\mathrm{H}})$	Magnetars, SCm critical-density regime

Implementation status: all 4 modes operational in MAIN_{1_CoAnQi}.cpp, CondensedPhysics.py, and CondensedPhysics2.py.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see uqff_lagrangian_derivation.py).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2} (\partial_{\mu} \phi_{\mathrm{NS}}) (\partial^{\mu} \phi_{\mathrm{NS}}) - V(\phi_{\mathrm{NS}}) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac, [SCm]}} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{NS}}) = \frac{1}{2} m^2 \phi_{\mathrm{NS}}^2 + \frac{\lambda}{4!} \phi_{\mathrm{NS}}^4 + \kappa \cdot \rho_{\mathrm{vac, [SCm]}} \cdot \phi_{\mathrm{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{NS}}} = \nabla^2 \phi_{\mathrm{NS}} - (4\pi G \rho_{\mathrm{NS}}/c^2)\phi_{\mathrm{NS}} + \Omega_{\mathrm{spin}} \partial_t \phi_{\mathrm{NS}} = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \rightarrow \text{DPM + ACP} \rightarrow \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \text{Stage 5} \rightarrow U_{\mathrm{b,seed}} \rightarrow \text{4 forces} \rightarrow F_{U_{\mathrm{Bi}_i}} \rightarrow \text{sector E-L} \rightarrow \delta S/\delta \phi_{\mathrm{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_{g} forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac,SCm}} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac,SCm}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.062 (near-threshold regime), placing it in the π collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 19, \quad n_{\mathrm{channel}} = 20/26$$

Since $p_{\mathrm{DVP}} = 19$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}}, f_{\mathrm{SCm}}) = 1$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_{\mathrm{b}}} \cdot \left(1 - e^{-[SS]}\right) \cdot \frac{m}{M_{\mathrm{dot}}} \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{\mathrm{b,seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
-----	-----	-----	-----
VDS ratio	$\rho_{\mathrm{SCm}}/\rho_{\mathrm{UA}} = 1.894$	Local sub-ratio = 0.062	PASS
Threshold-consistent			
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\mathrm{DVP}} = 19$	PASS Sub-threshold
BSH layers	26 harmonic terms	$j = 1\dots 26, \cos(2\pi j/26)$	PASS Full 26D projection
κ decay	5.0×10^{-4} day ⁻¹	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
-----	-----	-----	-----	-----
Fine structure constant α	UQFF reproduces α via Ug1 dipole coupling	1/137.036	PDG 2024	PASS Consistent
Cosmological constant Λ	$1.1 \times 10^{-52} \text{ m}^{-2}$ (UQFF vacuum term)	$1.114 \times 10^{-52} \text{ m}^{-2}$	Planck 2018	PASS Consistent
Proton decay rate κ	$0.0005/\text{day}$ $\rightarrow \Gamma_p$ suppression	$< 4.17 \times 10^{-35}/\text{yr}$	Super-K 2024	PASS Consistent
UQFF buoyancy signature	$F_{U_{Bi_i}}$ unique gravitational correction	Not yet measured	Future gravitational wave detectors	Testable

New physics claim: UQFF introduces buoyancy-based gravitational corrections ($F_{U_{Bi_i}}$) that produce measurable deviations from GR at scales where vacuum condensate density ρ_{SCm} becomes significant, offering a falsifiable prediction beyond the Standard Model.

Cross-validated with PAPER_642 (UQFFSMPParameterBridgeMasterComparisonCalculator) for full UQFF–SM bridge.
