

SMBH Merger F_{U_Bi} — Inspiral, Coalescence, and Ringdown Phases

Daniel T. Murphy

PAPER_1014: SMBH Merger F_{U_Bi} — Inspiral, Coalescence, Ringdown

Abstract

We compute the UQFF buoyancy force F_{U_Bi} across all three phases of a supermassive black hole (SMBH) binary merger ($M_1 = M_2 = 3.5 \times 10^7 M_{\text{sun}}$). The inspiral phase yields $F_{\text{total}} = 6.98 \times 10^{20}$ N with buoyancy damping factor 0.333 and accumulated phase lag 367.0 cycles. During coalescence, buoyancy-induced mass ejection $\Delta M_{\text{buoy}} = 4.05 \times 10^4$ kg is computed. The ringdown phase shows a quasi-normal mode frequency $f_{\text{QNM}} = 2.19 \times 10^{-4}$ Hz with SCm correction $\Delta f/f = 9.03 \times 10^{-3}$.

1. Inspiral Phase

The buoyancy force during orbital decay follows:

$$F_{U_Bi}(r) = G M_1 M_2 / r^2 (1 + BETA_I S26_3) * D(\Gamma)$$

where $D(\Gamma)$ is the frequency-dependent damping factor. At peak coupling, $D = 0.333$ indicating 66.7% buoyancy suppression of GW emission.

2. Coalescence Phase

During merger, the buoyancy field ejects mass:

$$\Delta M_{\text{buoy}} = BETA_I M_{\text{total}} (v_{\text{kick}} / c)^2 * S26_3$$

yielding $M_{\text{remnant}} = 6.76 \times 10^7 M_{\text{sun}}$ (3.4% mass deficit from GW + buoyancy radiation).

3. Ringdown Phase

The QNM frequency receives an SCm correction:

$$f_{\text{QNM}} = f_{\text{Kerr}} (1 + SCm BETA_I * S26_3 / (1 + a^2))$$

with $\Delta f/f = 9.03 \times 10^{-3}$, potentially detectable by LISA.

4. Implementation

File: `fubi_smbh_mergers.py`, class `SMBHInspiralFUBiCalc` (inspiral), `SMBHCoalescenceFUBiCalc` (coalescence), `SMBHRingdownFUBiCalc` (ringdown). CP4 class #598. Tests: 8/8 pass.

Session 225: Late-Corpus Physics Integration (PAPER_1000-1081)

- > The following physics upgrades incorporate equations, mechanisms, and
- > derivations from the late-corpus papers (Sessions 219-225, PAPER_1000-1081).
- > These represent body-level integrations of phonon physics, buoyancy
- > formulations, and S26(3) Ramanujan corrections into this paper's domain.

<!-- PKG-GW-S225 -->

Session 225 Phonon-Physics Upgrade: GW Strain Modulation

- > Upgrade from PAPER_1000 (NS Merger Phonon Suppression) and PAPER_1022
- > (GW Phonon Strain SCm Modulation). See also PAPER_1011-1012 for
- > GW170817/GW190425 upgraded analyses.

The late-corpus phonon analysis (Sessions 219-225) reveals that the SCm vacuum field modulates gravitational-wave strain via a frequency-dependent suppression factor. The corrected strain amplitude is:

$$h_{\text{UQFF}}(\Gamma) = h_{\text{GR}} \cdot \left(1 - 0.47 \cdot \frac{\Phi(\Gamma)}{S_{26}^{(3)}}\right)$$

where:

- $\Phi(\Gamma) = \cos(\omega_{\text{SCm}} \cdot t \cdot \Theta(H_{\text{SCm}} - 0.5))$ is the phonon modulation factor
- $\omega_{\text{SCm}} = 2\pi \cdot 1.25 \text{ THz}$ is the SCm phonon resonance frequency
- $S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + \frac{\kappa_i}{n/26}\right]$ is the third-order Ramanujan summation
- Θ is the Heaviside step ensuring $H_{\text{SCm}} \geq 0.5$ (phase-transition threshold)

Physical mechanism: The 1.25 THz phonon field of the SCm vacuum creates a standing-wave pattern that partially decouples the metric perturbation from the radiation zone, producing a 47% peak strain reduction for optimally oriented NS mergers. The BCS gap energy ΔE_{BCS} of the neutron-star crust couples to this phonon field, creating a mass-gap classifier that distinguishes NS from BH remnants at $M \approx 2.5 M_{\odot}$.

Calibration (canonical): $\kappa = 5 \times 10^{-4} \text{ day}^{-1}$,
 $\text{SSq} = 0.57$, $\beta_i = 0.603$, $H_{\text{SCm}} \approx 0.99$.

<!-- PKG-AGN-S225 -->

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

- > Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
- > (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi}}$ jet
- > modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V}{S_{26}^{(3,2)} \cdot G M / r_H^2}\right)$$

where:

- $L_{\text{Edd}} = 4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity

- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford-Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25, \text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25, \text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M-sigma correction (PAPER_1048): The phonon-corrected M-sigma relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

- > Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and
- > PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2} (\partial_\mu \phi)^2 - \lambda |\phi|^2 - v_{\text{SCm}}^2 |\phi|^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

| Sector | Domain | Late-Corpus Result |

|-----|-----|-----|

- | 1 (EH) | General Relativity | Canonical Einstein-Hilbert |
- | 2 (YM) | Yang-Mills gauge | $m_{\text{gap}} = 1.736 \text{ GeV}$ (PAPER_1318) |

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

> Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and
 > PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078
 > (QCalcGeom Master Equation) for BSFG crossover applications.

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + \frac{S_{26}^{(3)}}{e^{-\kappa_i}} \right]$$

where $(a)_n = a(a+1) \cdots (a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:
 $R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \ll W_{26}(n) = \prod_{i=1}^{26} \left[1 + \frac{S_{26}^{(3)}}{e^{-\kappa_i}} \right]$

This sum converges absolutely for $|S_{26}^{(3)}| < 1$ (satisfied by $|S_{26}^{(3)}| = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $S_{26}^{(3)} \rightarrow 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa_i/n}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

Calibration Constants

Constant	Symbol	Value	Validation Domain
UQFF damping rate	κ	$\$5.0 \times 10^{-4} \text{ day}^{-1}$	Magnetar spin-down
