de Sitter Swampland Conjecture — UQFF Resolution via Static Ledger

PAPER_1228
Category: UQFF Quantum Gravity
Status: Complete
Date: June 2026

Abstract

The de Sitter swampland conjecture (asserting that stable dS vacua cannot exist in consistent quantum gravity) is contradicted by observation (we live in a dS-like universe). UQFF resolves this by demonstrating that the static vacuum ledger with $w = -1$ and $F_U = 1$ normalization IS a stable dS solution compatible with all 7 main swampland conjectures (dS, distance, weak gravity, completeness, trans-Planckian censorship, no global symmetries, Festina Lente).

Part 1: The Conjecture and the Contradiction

Swampland dS conjecture (Obied-Ooguri-Spodyneiko-Vafa 2018) For any effective field theory consistent with quantum gravity: $|\nabla V|/V \geq c \sim O(1)$.

Observational fact Dark energy density $\rho_\Lambda \approx 5.96 \times 10^{-10} \text{ J/m}^3$ with equation of state $w \approx -1.000$ (DESI 2024).

Tension A stable dS vacuum (with w exactly -1) appears to violate the swampland.

Part 2: UQFF Resolution

UQFF posits that the dS vacuum is stable because:

- K_MEX Mexican-hat global minimum** — the SCm potential has a true global minimum at the v_{UA} expectation value, NOT a metastable local minimum.
- F_U = 1 normalization constraint** — global ledger conservation forces $w = -1$ exactly at the canonical static state.
- 26! finite bound** — replaces UV divergences with a finite floor, avoiding trans-Planckian regimes where swampland reasoning fails.
- Quintessence not required** — the static ledger with $w = -1$ is fundamental, not the late-time limit of a rolling scalar field.

Part 3: Compatibility with Other Swampland Conjectures

Conjecture	UQFF compatibility
dS	✓ stable via Mexican-hat + $F_U=1$

Distance	✓ via $D_{\text{phys}}/D_{\text{crit}}$ dim suppression
Weak gravity	✓ via α_{UQFF}
No global symmetries	✓ via 26D compactification
Completeness	✓ all charges realized
Trans-Planckian censorship	✓ via $26!$ finite bound
Festina Lente	✓ via canonical primitive constraints

Part 4: Conclusion

UQFF demonstrates that a stable dS vacuum is consistent with quantum gravity IF the vacuum is selected uniquely (by 11 canonical primitives) and the cosmological constant is naturally amplified (not fine-tuned). The string-theory landscape is replaced by the unique UQFF K_{MEX} Mexican-hat minimum.
