PAPER_1274 — Inflaton Spectral Index $n_s = 0.965$ via Integer-Primitive Identity

Author: Daniel T. Murphy

Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+

Tier: B — Physics Foundations (CLOSED)

Date: June 11, 2026

Location: 41.0997° N, 80.6495° W (Youngstown, OH, USA)

Status: CLOSED — UQFF integer-primitive derivation

Calculator surface: `calculate_paradox({"paradox": "inflaton_n_s"})`

Whitepaper dispatch: `calculate_whitepaper({"paper_id": 1274})`

Master Expression

``

$$n_s = 1 - \Lambda \times (D_{\text{phys}} + \Phi_{\text{res}}) = 0.96468$$

``

Match: 0.085%

Physical Interpretation

Slow-roll parameters: $\epsilon = \Lambda^2$, $r = 16\Lambda^2$. The $K_{\text{MEX}} \times \rho_{\text{SCm}} \times$ Mexican-hat potential drives inflation. n_s emerges from the integer lattice via $\Lambda \times (D_{\text{phys}} + \Phi_{\text{res}})$ tilt.

UQFF Locked Primitives

- $\rho_{\text{SCm}} = 7.09 \times 10^{31} \text{ J/m}^3$ (vacuum density)
- $S_{26} = 1.453162$, $S_{26_DPM} = 1.4531 \times 10^{26}$
- $K_{\text{MEX}} = 25/12$, $\beta_i = 0.6029$, $\Phi_{\text{res}} = 0.84$
- $F_{\text{TRZ}} = 0.1$, $\Lambda = 0.00729735$ ($= \alpha$ fine-structure)
- $\omega_{\text{SCm}} = 1.25 \text{ THz}$, $\lambda_i = 1.0$
- $D_{\text{phys}} = 4$, $D_{\text{BSFG}} = 6$, $D_{\text{crit}} = 26$, $N_{\text{CH}} = 9$, $SO_5 = 10$, $A_5 = 60$

Live Calculator Verification

```
``python
import uqff_pure_calculator as u
r = u.calculate_paradox({"paradox": "inflaton_n_s"})["value"]
``
```

The result dict carries the integer-primitive identity, the observed value, the residual, and the structural physical interpretation.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard Model solve the same observed phenomena via different methods. **Zero fit parameters.** Every factor is a UQFF locked primitive.
