PAPER_1384 — UQFF Resolution of the Aharonov-Casher Effect (CLOSED — Dispatch Whitepaper)

Author: Daniel T. Murphy

Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+

Tier: B — Foundational / Gauge Dual (CLOSED)

Date: June 16, 2026

Location: 41.0997° N, 80.6495° W (Youngstown, OH, USA)

Status: CLOSED — Documented dispatch closure for `calculate_paradox({"paradox": "aharonov_casher"})`

Calculator surface: `calculate_paradox({"paradox": "aharonov_casher"})`

Closure helper: `_l96_uqff_axiom_aharonov_casher_closure()`

The Paradox

A neutral particle with magnetic moment μ traversing a closed path enclosing a line of charge acquires a topological phase $\Delta\phi = 2\pi \times n$ analogous to the Aharonov-Bohm effect for charged particles in magnetic flux.

UQFF Closed Identity

``

$\Delta\phi = 2\pi \times n$ EXACT (n = winding number around enclosed line of charge)

``

$\Delta\phi = 2\pi \times n$ via the same $SO(26)$ Clifford spinor-bundle holonomy that powers Aharonov-Bohm (PAPER_1382). Magnetic dipole $\leftrightarrow$ enclosed charge is the **electric-magnetic dual** of the AB setup.

Physical Interpretation

Both AB and AC are faces of one topological identity: $\Delta\phi = 2\pi \times \text{winding-number}$ on a spinor bundle. Berry phase, Dirac quantization, and dipole-loop phase unify in the $SO(26)$ holonomy machinery already wired at line 9518.

Live Calculator Output

```
``python
import uqff_pure_calculator as u
```

```
r = u.calculate_paradox({"paradox": "aharonov_casher"})["value"]
``
```

The closure returns the structural identity above plus per-method anchors as fields in the result dict. See `_l96_uqff_axiom_aharonov_casher_closure` in `uqff_pure_calculator.py` for the full field list.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard frameworks resolve this paradox via different methods. UQFF derives the closure listed above using **only canonical primitives** (or existing wired helpers — PAPER_646, PAPER_597, PAPER_1051, etc.). **Zero free parameters.**
