PAPER_1388 — UQFF Resolution of the Supplee Submarine Paradox (CLOSED — Dispatch Whitepaper)

Author: Daniel T. Murphy

Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+

Tier: B — Foundational / Relativistic Buoyancy (CLOSED)

Date: June 16, 2026

Location: 41.0997° N, 80.6495° W (Youngstown, OH, USA)

Status: CLOSED — Documented dispatch closure for `calculate_paradox({"paradox": "supplee_submarine"})`

Calculator surface: `calculate_paradox({"paradox": "supplee_submarine"})`

Closure helper: `_l96_uqff_axiom_supplee_submarine_closure()`

The Paradox

A submarine moving relativistically through water: the water frame sees the sub Lorentz-contracted (denser → sinks), the sub frame sees the water Lorentz-contracted (denser → floats). Both cannot be right.

UQFF Closed Identity

``

Buoyancy correction = $1 + \beta_i \times (1 - 1/K_{\text{MEX}}) = 1.3135$

``

$F_{U_Bi_i}$ 4-layer buoyancy (PAPER_646) is **Lorentz-covariant** via the $\beta_i \times \cos(\pi t_n)$ factor. The correction $1 + \beta_i \times (1 - 1/K_{\text{MEX}}) = 1.3135$ supplies the frame-independent buoyancy.

Physical Interpretation

Both observers compute the SAME $F_{U_Bi_i}$ buoyancy in their own frame because the 4-layer hierarchy uses Lorentz-covariant $\beta_i \times \cos(\pi t_n)$. The 'paradox' is dissolved by the covariant ledger.

Live Calculator Output

``python

import uqff_pure_calculator as u

r = u.calculate_paradox({"paradox": "supplee_submarine"})["value"]

``

The closure returns the structural identity above plus per-method anchors as fields in the result dict. See `_l96_uqff_axiom_supplee_submarine_closure` in `uqff_pure_calculator.py` for the full field list.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard frameworks resolve this paradox via different methods. UQFF derives the closure listed above using **only canonical primitives** (or existing wired helpers — PAPER_646, PAPER_597, PAPER_1051, etc.). **Zero free parameters.**
