PAPER_1400 — UQFF Resolution of the Ship of Theseus (CLOSED — Dispatch Whitepaper)

Author: Daniel T. Murphy

Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+

Tier: B — Foundational / Identity (CLOSED)

Date: June 16, 2026

Location: 41.0997° N, 80.6495° W (Youngstown, OH, USA)

Status: CLOSED — Documented dispatch closure for `calculate_paradox({"paradox": "theseus_ship"})`

Calculator surface: `calculate_paradox({"paradox": "theseus_ship"})`

Closure helper: `_l96_uqff_axiom_theseus_ship_closure()`

The Paradox

Plutarch's Ship of Theseus: as each plank is replaced one by one, at what point (if any) does the ship become 'a different ship'? Classical identity theory has no canonical answer.

UQFF Closed Identity

``

`F_U = 1` identity preserved EXACT under gradual `F_U_Bi_i` redistribution

``

`F_U = 1` global ledger continuity (PAPER_646): identity is preserved as long as the `F_U = 1` ledger redistribution is gradual (no discontinuous jump). Discrete identity questions are replaced by the continuous `F_U` ledger — there is no point of identity-loss because `F_U = 1` is preserved throughout.

Physical Interpretation

UQFF dissolves the discrete identity question by replacing it with a continuous `F_U` ledger. The ship's identity is the persistence of the `F_U = 1` normalization, which survives gradual replacement of components but breaks under discontinuous reconstruction.

Live Calculator Output

``python

`import uqff_pure_calculator as u`

`r = u.calculate_paradox({"paradox": "theseus_ship"})["value"]`

``

The closure returns the structural identity above plus per-method anchors as fields in the result dict. See `_l96_uqff_axiom_theseus_ship_closure` in `uqff_pure_calculator.py` for the full field list.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard frameworks resolve this paradox via different methods. UQFF derives the closure listed above using **only canonical primitives** (or existing wired helpers — PAPER_646, PAPER_597, PAPER_1051, etc.). **Zero free parameters.**
