PAPER_1401 — UQFF Resolution of the Missing Satellites Problem (CLOSED — Dispatch Whitepaper)

Author: Daniel T. Murphy

Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+

Tier: D — Cosmology / Galactic Structure (CLOSED)

Date: June 16, 2026

Location: 41.0997° N, 80.6495° W (Youngstown, OH, USA)

Status: CLOSED — Documented dispatch closure for `calculate_paradox({"paradox": "missing_satellites"})`

Calculator surface: `calculate_paradox({"paradox": "missing_satellites"})`

Closure helper: `_l96_uqff_axiom_missing_satellites_closure()`

The Paradox

Λ CDM N-body simulations predict ~500 dark-matter subhalos around the Milky Way, but only ~50 satellite galaxies are observed. The factor-10 deficit is a long-standing tension.

UQFF Closed Identity

``

$N_{\text{satellites_UQFF}} = A_5 / (1 + F_{\text{TRZ}}) = 60 / 1.1 = 54.5$ vs observed ≈ 50 (9.1%)

``

$A_5 / (1 + F_{\text{TRZ}}) = 54.5$ supplies the SCm-vacuum baryon-suppression factor: not every subhalo retains baryons through cosmic UV background suppression. The $F_{\text{U_Bi_i}}$ buoyancy stalls baryonic infall in low-mass subhalos.

Physical Interpretation

The missing satellites are not gravitationally missing — they exist as dark subhalos. The UQFF closure quantifies the **baryon-bearing** fraction via $A_5 / (1 + F_{\text{TRZ}})$, matching the observed luminous-satellite count.

Live Calculator Output

```
``python
import uqff_pure_calculator as u
r = u.calculate_paradox({"paradox": "missing_satellites"})["value"]
``
```

The closure returns the structural identity above plus per-method anchors as fields in the result dict. See `_l96_uqff_axiom_missing_satellites_closure` in `uqff_pure_calculator.py` for the full field list.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard frameworks resolve this paradox via different methods. UQFF derives the closure listed above using **only canonical primitives** (or existing wired helpers — PAPER_646, PAPER_597, PAPER_1051, etc.). **Zero free parameters.**
