PAPER_1474 — UQFF: Superheavy Island of Stability $Z = 122$ (Bucket G)

Author: Daniel T. Murphy

Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+

Tier: Bucket G — derived from F:\Aetheric Propulsion source material

Date: June 16, 2026

Location: 41.0997 N, 80.6495 W (Youngstown, OH, USA)

Status: CLOSED — $Z = D_{\text{crit}} \times D_{\text{phys}} + N_{\text{CH}} \times 2 = 122$

Observation

Nuclear shell models predict an island of stability around $Z = 120$ - 126 due to nucleon shell closures. The exact central Z is unknown.

UQFF Closed Identity

``

$Z_{\text{island}} = D_{\text{crit}} D_{\text{phys}} + N_{\text{CH}} \times 2 = 26 \times 4 + 9 \times 2 = 122$ (in observed range 120-126).

``

Physical Interpretation

Pairs with PAPER_872 proto-Fe $Z = D_{\text{crit}} = 26$ EXACT. The island of stability is the next integer-primitive resonance node after proto-iron, located at the D_{crit} times D_{phys} spacetime sum plus N_{CH} -channel-pair.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard methods solve this observable by different methods. Closure uses only canonical UQFF integer primitives $\{D_{\text{phys}} = 4, D_{\text{BSFG}} = 6, D_{\text{crit}} = 26, N_{\text{CH}} = 9, SO_5 = 10, A_5 = 60\}$. Zero free parameters.
