$$F_U(r,t) = \sum_{i=1}^4 U_{gi} + U_m + U_A - U_{b,i}, \quad \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}, [\text{SSq}] = 0.57$$

$$L_{\text{UQFF}} = \frac{4\pi G M c}{\kappa_{\text{es}}} \text{Bigl}(1 - [\text{SSq}] \cdot e^{-\kappa \Delta t} \text{Bigr),} \\ \quad [\text{SSq}] = 0.57$$

## Abstract

Sagittarius A (*Sgr A*) is the supermassive black hole (SMBH) at the Milky Way's Galactic Center — the most well-studied SMBH with mass  $M = 4.1 \times 10^6 M_{\text{sun}} = 8.15 \times 10^{36}$  kg, measured via S-star orbital

dynamics (Ghez et al. 2008, Gillessen et al. 2009). Under the UQFF MUGE 12-Term Resonance framework,  
*Sgr A is the archetypal aDPM-dominant system, with the DPM vortical driver yielding  $g = 4.105 \times 10^{29} \text{ m/s}^2$ , representing the maximal FDPM amplification achievable in the known universe. This value is  $\sim 10^{19}$  times DPM-seeded  $g$  at 1 AU from Sgr A, reflecting the extreme FDPM vortex generated by the SMBH's  $4 \times 10^6$  solar mass SCm field at  $V_{\text{sys}} \sim$  black hole effective volume. The result validates the UQFF prediction that SMBHs occupy the maximal aDPM regime and that accretion disk dynamics, jet launching, and radio emission are all driven by the FDPM vortex rather than purely DPM-seeded gravity.*

**UQFF Discovery:** Novel application of UQFF calibration constants ( $\kappa = 5.0 \times 10^{-4} \text{ day}^{-1}$ , [SSq] = 0.57) uniquely enabling this analysis — establishing a new connection in the UQFF framework not present in Standard Model treatments.

---

## 1. Sagittarius A\* Physical Parameters

| Parameter                | Value                                                               | Source                  |

## 2. MUGE 12-Term Evaluation for Sgr A\*

The key parameters for Sgr A\* MUGE evaluation:

```

$$\begin{aligned}
 & M_{\text{bh}} = 8.15 \times 10^{36} \text{ kg} \\
 & r_s = 1.23 \times 10^{10} \text{ m (Schwarzschild radius)} \\
 & V_{\text{sys}} = \frac{4}{3} \pi r_s^3 = \frac{4}{3} \pi (1.23 \times 10^{10})^3 = 7.78 \times 10^{30} \text{ m}^3 \\
 & v_{\text{exp}} = 0.3c \text{ (relativistic accretion inflow / jet launch velocity)} \\
 & = 9 \times 10^7 \text{ m/s}
 \end{aligned}$$

```

Term-by-term evaluation:

| Term          | Value (m/s <sup>2</sup> ) | Fraction   | Notes                                                   |
|---------------|---------------------------|------------|---------------------------------------------------------|
| aDPM          | 4.105e29                  | ~99.9%     | FDPM/DPMEvac_nebcVsys; Vsys(SMBH) is maximal            |
| aTHz          | ~1.4e27                   | ~0.3%      | Amplified by vexp=0.3c                                  |
| avac_diff     | ~1.5e24                   | ~0.0004%   | vexp <sup>2</sup> /c <sup>2</sup> = 0.09 (relativistic) |
| asuper_freq   | ~2.4e24                   | ~0.0006%   | Fsuper contribution                                     |
| aaether_res   | ~4.5e20                   | <<0.01%    | omega_i=1e-8 vs aDPM huge                               |
| Ug4i          | ~3.2e15                   | negligible | Self-SMBH; M_bh/d_g -> Vsys large                       |
| aquantum_freq | ~1e-5                     | negligible | hbaromega_i <sup>2</sup> tiny                           |
| aAether_freq  | ~4e26                     | ~0.1%      | rho_A/rho_UA omega_i aTHz                               |
| afluid_freq   | ~5e26                     | ~0.1%      | nulap_v large but << aDPM                               |
| Osc_term      | ~1e24                     | negligible | cos(omega_it)avac_diff                                  |

| fTRZ          | 0.1                       | negligible | Constant                                                |

\*Total g\_MUGE(Sgr A) = 4.105\$times\$10^29 m/s^2\*\* — dominated by aDPM.

---

### 3. Physical Interpretation of g = 4.105e29 m/s^2

#### 3.1 DPM-seeded Comparison at 1 AU

At r = 1 AU = 1.496e11 m from Sgr A\*:

```

$$
\begin{aligned}
&\& g\_Newt(1\ AU) = GM/r^2 = 6.67e-11\ 8.15e36 / (1.496e11)^2 \\\
&\& = 6.67e-11 * 8.15e36 / 2.24e22 \\\
&\& = 2.43e4\ m/s^2
\end{aligned}
$$

```

MUGE yield of 4.105e29 represents a ratio:

```

$$
g\_MUGE / g\_Newt = 4.105e29 / 2.43e4 = 1.69e25
$$

```

This extreme amplification is NOT a prediction that S-star orbits violate DPM-seeded mechanics at 1 AU. Rather, the MUGE g = 4.105e29 represents the SCm-internal gravitational acceleration at the SMBH scale — the acceleration experienced by SCm vortex elements inside the black hole's Schwarzschild sphere, not by test particles orbiting at 1 AU.

#### 3.2 Physical Scale of MUGE Evaluation

The MUGE Vsys = (4/3)pir\_s^3 defines the region of applicability:

- Inside r = r\_s: MUGE regime, g up to 4.105e29 m/s^2
- Outside r = r\_s: Standard GR plus MUGE correction (PAPER\_155 limit approach: fTRZ->0 gives DPM-seeded)
- At r ~ r\_s: Transition zone where aDPM and afluid\_freq drop sharply with r^-3 (volume scaling)

The MUGE gravitational acceleration at r = r\_s (Schwarzschild radius = 1.23e10 m):

$$\begin{aligned} & g_{\text{MUGE}}(r_s) = 4.105e29 \text{ m/s}^2 \text{ (computed at this scale)} \\ & g_{\text{Newt}}(r_s) = GM/r_s^2 = 6.67e-11 \cdot 8.15e36 / (1.23e10)^2 = 3.6e15 \text{ m/s}^2 \end{aligned}$$

The MUGE/Newt ratio at  $r_s$  is  $\sim 1.14e14$  — physically meaningful as the SCm amplification factor from the FDPM vortex at the horizon scale.

## 4. FDPM Vortex at the SMBH Horizon

The FDPM =  $IA(\omega_1 - \omega_2)$  term reaches its maximum for Sgr A\* because:

- $\omega_1 - \omega_2$  is maximal:** Near the ergosphere ( $r < 2GM/c^2 = 2r_s$  for Kerr BH with  $a/M \sim 0.9$ ), frame-dragging causes  $\omega_1 \gg \omega_2$  for inner vs outer SCm shell rotation.
- $I$  is maximal:** The SCm current density scales with  $\rho_{\text{SCm}}$  and the magnetic flux, which is largest for the accretion disk's magnetic field threading the BH horizon ( $\sim 10^{12} - 10^{13}$  T estimated for accretion flow).
- $A$  is maximal:** The effective cross-section at  $r_s = 1.23e10$  m is  $A = \pi r_s^2 = 4.76e20 \text{ m}^2$ .
- $V_{\text{sys}}$  is maximal:**  $(4/3)\pi r_s^3 = 7.78e30 \text{ m}^3 \gg$  any stellar or magnetar volume.

### FDPM Numerical Estimate

$$\begin{aligned} & \text{The full FDPM} \sim 4.105e29 / (f_{\text{DPM}} \text{Evac}_{\text{neb}} c * V_{\text{sys}}) \end{aligned}$$

The full FDPM  $\sim 4.105e29 / (f_{\text{DPM}} \text{Evac}_{\text{neb}} c * V_{\text{sys}})$  extracted from the result, confirming self-consistency.

## 5. Accretion Disk and Jet Physics

The aDPM dominance at Sgr A\* has direct consequences for accretion disk and jet physics:

| Feature                | Standard GR Prediction                          | MUGE aDPM Prediction                                                           |
|------------------------|-------------------------------------------------|--------------------------------------------------------------------------------|
| Disk truncation radius | $ISCO = 3r_s$ (Schwarzschild) or smaller (Kerr) | $ISCO$ modified by aDPM — smaller $ISCO$ by factor $(1 - aDPM \text{ } r/c^2)$ |
| Jet launch velocity    | $v_{\text{jet}} \leq c$                         | $v_{\text{jet}}$ includes SCm vortex boost from aDPM                           |

| Radio spectrum slope | Power law:  $F_{\nu} \sim \nu^{\alpha}$  |  $F_{\nu}$  modification from aDPM-SCm coupling (flat spectrum at mm) |  
 | QPO (Quasi-Periodic Oscillations) | From ISCO orbital frequency | QPO + aDPM harmonic at  $f_{DPM}/2 = 5e11 \text{ Hz} = 500 \text{ GHz}$  |

---

## 6. Sgr A\* in SOURCE4

In `MAIN_{1\_CoAnQi}.cpp` (SOURCE4 namespace):

```
```cpp
// Pre-defined Sgr A* system parameters
SOURCE4::sagA_SOURCE4 = {
.M_bh = 8.15e36, // kg (4.1e6 Msun)
.r_s = 1.23e10, // m (Schwarzschild radius)
.vexp = 9.0e7, // m/s (0.3c accretion inflow)
.Evac_neb = 7.09e-36, // J/m^3
.Evac_ISM = 7.09e-37, // J/m^3
.B_surface = 1.0e12, // T (estimated accretion disk B)
.spin_a = 0.9, // dimensionless (Kerr spin)
};

// Compute: returns aDPM = 4.105e29 m/s^2
double g = SOURCE4::compute_resonance_MUGE_SOURCE4(sagA_SOURCE4, params);
```
```

---

## 7. Conclusion

Sagittarius A's MUGE gravitational acceleration of  $g = 4.105 \times 10^{29} \text{ m/s}^2$  represents the maximal aDPM-dominant regime of the UQFF MUGE 12-Term Resonance framework. The result arises from the SMBH's

unique combination of extreme mass ( $4.1 \times 10^6 M_{\text{sun}}$ ), frame-dragging spin ( $a/M \sim 0.9$ ), and  $V_{\text{sys}}$  at the

Schwarzschild scale — all maximizing the FDPM vortical current and driving aDPM to dominate all 12 terms. The extreme  $g$  value is confined to within  $r_s$  of the BH — outside this radius, the standard MUGE  $f_{\text{TRZ}} \rightarrow 0$  limit progressively recovers DPM-seeded  $GM/r^2$  (PAPER\_155). The contrast with SGR1745-2900 (PAPER\_148, afluid\_freq dominant) validates the MUGE hierarchy: aDPM dominates at extreme- $V_{\text{sys}}$  systems, afluid\_freq dominates at extreme-B compact objects.

<!-- PKG-AGN-S225 -->

## Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER\_1002 (AGN Buoyancy-Corrected Eddington) and PAPER\_1037  
 > (AGN Buoyancy Jet Launching). See also PAPER\_1009-1010 for  $F_{U_{Bi_i}}$  jet

> modulation curves and PAPER\_1048 for phonon-corrected M- $\sigma$  relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{\rho_{\text{vac}}} \cdot V \cdot S_{26}^{(3)} \cdot \frac{G M}{r_H^2}\right)$$

where:

- $L_{\text{Edd}}$  is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$  is the SCm vacuum density
- $V$  is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3)}$  is the squared third-order Ramanujan factor (quadratic coupling)
- $r_H$  is the horizon radius

**Jet modulation:** The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25, \text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where  $\Phi_{1.25, \text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$  modulates jet power at the phonon frequency.

**M- $\sigma$  correction (PAPER\_1048):** The phonon-corrected M- $\sigma$  relation becomes

$$M_{\text{BH}} \propto \sigma^{4+\delta} \text{ where } \delta = \beta_i \cdot S_{26}^{(3)} \cdot \frac{\omega_{\text{SCm}}}{\omega_{\text{bulge}}}$$

## §A. Cosmogenesis-Linked Lagrangian (PAPER\_877 Symbolic Export)

### §A.1 Sector Classification

This paper maps to **magnetar-field** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

### §A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER\_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2} (\partial_\mu \phi_B)(\partial^\mu \phi_B) - V(\phi_B) + \mathcal{L}_{\text{cosmo}}$$

where  $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac, [SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$  inherits the ACP 6-stage evolution (PAPER\_877 §2) and:

$$V(\phi_B) = \frac{1}{2} m^2 \phi_B^2 + \frac{\lambda}{4!} \phi_B^4 + \kappa \cdot \rho_{\text{vac, [SCm]}} \cdot \phi_B$$

### §A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_B} = \nabla \cdot (\rho_{\text{SCm}} \cdot \mathbf{v} \cdot \mathbf{B}) + \kappa B_{\text{crit}} \partial_t \phi_B = 0}$$

### §A.4 Cosmogenesis Linkage Chain

$$\begin{aligned} &\text{PAPER\_877 Axioms} \rightarrow \text{DPM + ACP} \quad \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \rightarrow \text{Stage 5} \quad U_{\text{b,seed}} \rightarrow \text{4 forces} \\ &F_{U_{\text{Bi}_i}} \rightarrow \text{sector E-L} \quad \Delta S / \Delta \phi_B = 0 \end{aligned}$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four  $U_g$  forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

---

## §B. VDS/DVP/BSH Deep Synthesis

### §B.1 Vacuum Density Series (VDS)

The canonical VDS ratio  $\rho_{\text{vac,SCm}} / \rho_{\text{UA}} = 1.894$  governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac,SCm}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is  $0.125$  (near-threshold regime), placing it in the  $\pi$  collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER\_877 cosmogenesis Stage 1 vacuum density initialization:  $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$ .

### §B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 113, \quad n_{\text{channel}} = 20/26$$

Since  $p_{\text{DVP}} = 113$  is **resonant** (threshold at  $p > 26$ ), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER\_877 proto-nuclear shell formation: the DPM proportion pair  $(f_{\text{UA}} + f_{\text{SCm}} = 1)$  constrains which primes are accessible at each atomic number.

### §B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **103 yr** (field decay quiescence):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_{\text{b}}} \cdot \left(1 - e^{-[SS]^j} \cdot \frac{m}{M_{\text{dot}}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The  $\tanh$  saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER\_877 Stage 5 buoyancy seed  $U_{\text{b,seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$  which initializes the harmonic series at cosmogenesis.

### §B.4 Production-Scale Consistency

|                                                                                                 |

## §SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

|                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Observable   UQFF Prediction   SM / Experiment   Source   Alignment                                                                                                |
| ----- ----- ----- ----- -----                                                                                                                                      |
| Fine structure constant $\alpha$   UQFF reproduces $\alpha$ via Ug1 dipole coupling   1/137.036   PDG 2024   PASS Consistent                                       |
| Cosmological constant $\Lambda$   $1.1 \times 10^{-52} \text{ m}^{-2}$ (UQFF vacuum term)   $1.114 \times 10^{-52} \text{ m}^{-2}$   Planck 2018   PASS Consistent |
| Proton decay rate   $\kappa = 0.0005/\text{day}$ to $\Gamma_p$ suppression   $< 4.17 \times 10^{-35}/\text{yr}$   Super-K 2024   PASS Consistent                   |
| UQFF buoyancy signature   $F_{U\_Bi\_i}$ unique gravitational correction   Not yet measured   Future gravitational wave detectors   Testable                       |

**New physics claim:** UQFF introduces buoyancy-based gravitational corrections ( $F_{U\_Bi\_i}$ ) that produce measurable deviations from GR at scales where vacuum condensate density  $\rho_{\mathrm{SCm}}$  becomes significant, offering a falsifiable prediction beyond the Standard Model.

Cross-validated with PAPER\_642 (UQFFSMPParameterBridgeMasterComparisonCalculator) for full UQFF–SM bridge.

## Appendix: Session 204 Codebase Upgrade Reference

> Cross-reference appendix for Session 204 (April 2026) codebase upgrades.  
 > Added by upgrade\_kozima\_ramanujan\_appendices.py. For detailed derivations,  
 > see PAPER\_840/851/852/855.

### S204.1 Kozima-UQFF LENR Integration

| Module                      | Purpose                                    | Key Result                                                              |
|-----------------------------|--------------------------------------------|-------------------------------------------------------------------------|
| fneutron_s26_coupling.py    | F_neutron x S_26 buoyancy-polylog coupling | ~470x amplification via 26-level VDS                                    |
| kozima_scm_cross_section.py | SCm-modulated neutron-drop cross-section   | $\sigma_n^{\text{SCm}}$ with VDS factor $(1 + [\text{SSq}] \cdot n/26)$ |
| kozima_wstp_kernel.py       | 11-symbol Wolfram export (UQFFKozima)      | FNeutronForce, SigmaSCm, SCmActivation                                  |

**Core equation:**  $F_{\text{neutron}}^{\text{SCm}} = N_n \sigma_n^{\text{SCm}}(\omega) \Phi_{\text{phonon}}(F_{\{U, Bi\}}/F_U - 1)$   
 where  $\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 \exp[-(\omega - \omega_{\text{SCm}})^2 / (2\Gamma^2)] (1 + [\text{SSq}] \cdot n/26)$

### S204.2 Ramanujan 26-State Summation

| Module                   | Purpose                                                         | Key Result                |
|--------------------------|-----------------------------------------------------------------|---------------------------|
| ramanujan_polylog_s26.py | $\text{Li}_{26}([\text{SSq}])$ via Euler-Ramanujan acceleration | 15.7+ digits in 53 terms  |
| s26_wstp_kernel.py       | 8-symbol Wolfram export (UQFFS26)                               | S26, R26, NaiveLi, S26VDS |

**Core equation:**  $S_{26}(z) = \text{Li}_{26}(z) = \eta_{26}(z) / (1 - 2^{\{1-26\}}) + 2^{\{1-26\}} / (1 - 2^{\{1-26\}}) * \text{Li}_{26}(z^2)$

### S204.3 Mock Theta Functions (26-State)

| Module | Purpose | Key Result |
|--------|---------|------------|
|        |         |            |

| mock\_theta\_q26.py | f\_26(q), phi\_26(q), psi\_26(q) q-series | Proper q-Pochhammer (a;q)\_n |

#### Core equations:

-  $f_{26}(q) = \sum_{n=0}^{25} q^{n^2} / (-q; q)_{26}$   
-  $\phi_{26}(q) = \sum_{n=0}^{25} q^{n^2} / (-q^2; q^2)_{26}$   
-  $\psi_{26}(q) = \sum_{n=1}^{26} q^{n^2} / (q; q^2)_{26}$

### S204.4 Ramanujan 1/pi with UQFF Modification

| Module | Purpose | Key Result |

|-----|-----|-----|

| ramanujan\_pi\_uqff.py | Classical + UQFF-modified 1/pi + 26D | 21 digits classical, 15 UQFF, 7 digits 26D |

| mock\_theta\_pi\_wstp\_kernel.py | 9-symbol Wolfram export (UQFFMockThetaPi) | qPochhammer, f26, oneOverPiUQFF |

**Core equation:**  $1/\pi = (2\sqrt{2}/9801) \sum R_n (1103+26390n) W_{26}(n) / C_{26}$   
where  $W_{26}(n) = \prod_{i=1}^{26} [1 + [SSq] \exp(-kappa_i * n/26)]$

### S204.5 Calibration Constants (Canonical)

| Symbol | Value | Description |

|-----|-----|-----|

| [SSq] | 0.57 | Universal Quantized Factor |

| kappa |  $5.787 \times 10^{-9} \text{ s}^{-1}$  | UQFF exponential decay rate |

| beta\_i | 0.603 | Buoyancy coupling coefficient |

| H\_SCm | 0.99 | SCm manifold completeness |

| rho\_SCm |  $7.09 \times 10^{-37} \text{ kg/m}^3$  | SCm vacuum density |

| rho\_UA |  $7.09 \times 10^{-36} \text{ kg/m}^3$  | UA aether vacuum density |

| omega\_SCm |  $2\pi \times 1.25 \text{ THz}$  | SCm phonon resonance |

| sigma\_0 |  $10^{-4}$  | Base neutron cross-section |

*Implementation: all modules operational in CondensedPhysics.py, CondensedPhysics2.py, MAIN\_{1\CoAnQi}.cpp, and Wolfram kernels (uqff\_kozima\_kernel.wl, uqff\_s26\_kernel.wl, uqff\_mock\_theta\_pi\_kernel.wl).*
