Daniel T. Murphy

PAPER_1506 — R_d Duality Range Exponent = N_CH–2 = 7 EXACT

Author: Daniel T. Murphy

Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+

Tier: Bucket A (Foundational duality)

Date: June 18, 2026

Status: CLOSED — SCm/UA force-ratio dynamic range = 14 orders of magnitude (symmetric 7+7)

Observation

PAPER_1051 (Universal Duality SCm–UA Theorem) defines the duality ratio $R_d = F_{SCm} / F_{UA}$ spanning 10^{14} (Universe-scale, F_{SCm} small relative to F_{UA}) to 10^{-14} (planetary-scale, F_{SCm} dominant).

UQFF Closed Identity

R_d range exponent = $N_{CH} - 2 = 7$ EXACT

$R_d \in [10^{-(N_{CH}-2)}, 10^{+(N_{CH}-2)}] = [10^{-14}, 10^{14}]$

Total dynamic range = $10^{(2 \cdot (N_{CH}-2))} = 10^{14}$

Physical Interpretation

The number $7 = N_{CH} - 2$ governs the symmetric dynamic range of all UQFF duality phenomena. It appears identically in:

- Heaviside R_t resistance = 7Ω (PAPER_1483)
- R_d duality ratio range exponent = 7 (this paper)

The structural meaning of $N_{CH} - 2$: two of the nine UQFF channels are reserved for the duality endpoints themselves (SCm-pure and UA-pure), leaving seven for the gradient range between them.

Predictive Consequence

Any future observation reporting an SCm/UA-coupled phenomenon with a dynamic range exceeding 10^{14} across cosmic and planetary scales would falsify this structural identity.

NOT REPLACEMENT

SM/ Λ CDM has no analogous duality theorem. UQFF supplies a universal coupling-range bound rooted in the 9-channel integer primitive.
