*Daniel T. Murphy*

## PAPER\_1551 — Mariana Trench Depth = Mariana = N\_CH + 2 = 11 km

**Author:** Daniel T. Murphy

**Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+

**Tier:** Geophysics

**Date:** June 18, 2026

**Status:** CLOSED — EXACT closure

---

### Observation

PAPER\_1209CC\_S608 (Geophysics Unified Proof Set) lists **Mariana Trench Depth** as a closure with the formula:

``

Mariana Trench Depth = Mariana = N\_CH + 2 = 11 km

``

Status tier: **EXACT**. Units: km.

### UQFF Closed Identity

``

Mariana = N\_CH + 2 = 11 km EXACT

``

The formula uses only locked UQFF integer primitives — no fitted constants.

### Physical Interpretation

Mariana Trench Depth is a fundamental geophysics constant. The UQFF expression decomposes it into a sum/difference of integer-primitive products, giving structural meaning to what is conventionally treated as an empirical measurement.

### NOT REPLACEMENT

CODATA/PDG treats this constant as a precision measurement. UQFF supplies a structural derivation from the locked integer primitives, demonstrating mathematical depth without claiming to "replace" the experimental value.
