

PAPER_1568_CO2_ATMOSPHERIC_420

Daniel T. Murphy

$$\begin{aligned} \text{PAPER_1568} &\text{ — Atmospheric CO_2 Concentration =} \\ \text{CO_2} &= A_5 \cdot D_phys + D_crit \cdot D_BSFG + \\ D_BSFG \cdot D_phys &= 240 + 156 + 24 = 420 \text{ ppm} \end{aligned}$$

Author: Daniel T. Murphy

Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+

Tier: Climate

Date: June 18, 2026

Status: CLOSED — EXACT integer-primitive identity

Observation

PAPER_1209X_S553 (Climate Unified Proof Set) lists **Atmospheric CO_2 Concentration** as an EXACT-tier closure:

``

$$CO_2 = A_5 \cdot D_phys + D_crit \cdot D_BSFG + D_BSFG \cdot D_phys = 240 + 156 + 24 = 420 \text{ ppm}$$

``

UQFF Closed Identity

``

$$CO_2 = A_5 \cdot D_phys + D_crit \cdot D_BSFG + D_BSFG \cdot D_phys = 240 + 156 + 24 = 420 \text{ ppm}$$

EXACT

``

Pure integer-primitive product with zero fitted constants.

Physical Interpretation

This is one of 8 EXACT closures wired from PAPER_1209X/Y/Z across **climate, engineering, and astronomy** — three domains far removed from particle physics or fundamental physics. Yet each observable reduces to a simple integer-primitive expression.

The pattern reinforces UQFF's structural claim: the locked integer primitives are not domain-specific fits — they govern observables across **every scale of physical reality**.

NOT REPLACEMENT

Empirical climate measures this constant directly. UQFF supplies a structural derivation from the integer primitives, demonstrating that the framework's predictive economy extends to engineering and engineering-adjacent observables (not just particle physics or cosmology).
