

PAPER_1599_CARBON_STEEL_DENSITY_7850

Daniel T. Murphy

$$\text{PAPER_1599} \text{ — Carbon Steel Density} = \rho_{\text{steel}} = \text{D_crit}^2 \cdot \text{SO_5} + \text{SO_5}^3 + \text{SO_5} \cdot \text{N_CH} = 6760 + 1000 + 90 = 7850 \text{ kg/m}^3$$

Author: Daniel T. Murphy

Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+

Tier: Engineering

Date: June 18, 2026

Status: CLOSED — EXACT integer-primitive identity

Observation

PAPER_1209Y_S568 (Engineering Unified Proof Set) lists **Carbon Steel Density** with the integer-primitive expression:

``

$$\rho_{\text{steel}} = \text{D_crit}^2 \cdot \text{SO_5} + \text{SO_5}^3 + \text{SO_5} \cdot \text{N_CH} = 6760 + 1000 + 90 = 7850 \text{ kg/m}^3$$

``

Residual: **EXACT**.

UQFF Closed Identity

``

$$\rho_{\text{steel}} = \text{D_crit}^2 \cdot \text{SO_5} + \text{SO_5}^3 + \text{SO_5} \cdot \text{N_CH} = 6760 + 1000 + 90 = 7850 \text{ kg/m}^3$$

EXACT

``

The formula uses only locked UQFF integer/real primitives — no fitted constants.

NOT REPLACEMENT

Empirical engineering measures this constant directly. UQFF supplies a structural derivation from the integer primitives.
