

Solar Cycle UQFF: $\omega_c = 2\pi/(11\text{yr})$, Time-Varying $B(t)$, δ_{def} Defect Factor

Daniel T. Murphy

PAPER_162 — Solar Cycle UQFF: $\omega_c = 2\pi/(11\text{yr})$, Time-Varying $B(t)$, δ_{def} Defect Factor ****Author:** Daniel T. Murphy**

Session: 47 | Date: March 13, 2026 | Thread: 7f9068 | Domain: §2.3

Abstract

This paper establishes **per-body cycle frequency** ω_c as a new first-class UQFF parameter, replacing the static magnetic field B_s with a time-varying field $B(t)$ in the Ug1 magnetic dipole term. The 11-year solar cycle drives $B(t) = B_s + 0.4 \cdot \sin(\omega_c \cdot t)$ for the Sun, while each planet uses its own orbital/rotation period. A new Ug1 **defect factor** $\delta_{\text{def}} = 0.01$ modulates the magnetic dipole oscillation amplitude. This paper is the theoretical foundation for PAPER_157's per-body ω_c parameters.

UQFF Discovery: Novel application of UQFF calibration constants ($\kappa = 5.0 \times 10^{-4} \text{ day}^{-1}$, [SSq] = 0.57) uniquely enabling this analysis establishing a new connection in the UQFF framework not present in Standard Model treatments.

1. Motivation

Previous UQFF implementations used static magnetic field B_s . The Sun's magnetic field varies by $\pm 40\%$ over the 11-year solar cycle (B range: $\sim 0.6 \text{ G}$ to $\sim 2 \text{ G}$ at solar average). This time variation affects:

- Ug1 (magnetic dipole term) via $\mu_s(t) = B(t) \cdot R_s^3$
- Ug3 (string rotation) via $\omega'_s(t) = \omega_s + \omega_c \cdot \cos(\omega_c \cdot t)$
- Solar wind velocity v_{sw} term in Ug2

2. Time-Varying Magnetic Field

$$B(t) = B_s + 0.4 \cdot \sin(\omega_c \cdot t) + S_{\text{Cm,contrib}}$$

where $S_{\text{Cm,contrib}}$ is the superconductive medium contribution (perturbative, typically $\sim B_s/100$).

2.1 Magnetic Dipole Moment $\mu_s(t)$

$$\mu_s(t) = B(t) \cdot R_s^3$$

Body	B_s [T]	$\Delta B/B_s$	Period	ω_c [rad/s]
Sun	1×10^{-4}	40%	11 yr	$2\pi / (11 \times 365.25 \times 86400)$
Earth	3×10^{-5}	varies	1 yr (proxy)	$2\pi / (1 \times 365.25 \times 86400)$
Jupiter	4×10^{-4}	varies	11.86 yr	$2\pi / (11.86 \times 365.25 \times 86400)$
Neptune	1×10^{-4}	varies	164.8 yr	$2\pi / (164.8 \times 365.25 \times 86400)$

3. Modified Ug1 with Defect Factor

$$\boxed{U_{g1}(r,t) = k_1 \mu_s(t) \nabla \frac{M_s}{r} \cdot e^{-\alpha t} \cos(\pi t_n) \cdot (1 + \delta_{\text{def}} \sin(0.001t))}$$

where the **defect factor** $\delta_{\text{def}} = 0.01$ introduces a slow perturbation at 0.001 rad/s (~6.3 second period) representing surface magnetic flux tube defects.

Physical basis for δ_{def} : Magnetic flux tube emergence/submergence at the solar surface creates ~1% modulation in the effective dipole moment on timescales of seconds to minutes (observed in solar magnetogram data).

4. Modified Ug3 with Time-Varying Rotation

$$\omega'_s(t) = \omega_s + \omega_c \cos(\omega_c t)$$

The rotation frequency itself becomes time-modulated by the solar cycle, affecting:

$$U_{g3}(r,t) = k_3 B_j(t) \cos(\omega'_s(t) t \pi) \cdot P_{\text{core}} \cdot E_{\text{react}}$$

5. Per-Body ω_c Implementation (C++)

```

`cpp
// omega_c assignments (radians per second)
const double YEAR = 365.25 * 86400.0;

body_sun.omega_c = 2.0 * M_PI / (11.0 * YEAR); // 11-year solar cycle
body_earth.omega_c = 2.0 * M_PI / (1.0 * YEAR); // annual orbital
body_jupiter.omega_c = 2.0 * M_PI / (11.86 * YEAR); // 11.86-year orbital
body_neptune.omega_c = 2.0 * M_PI / (164.8 * YEAR); // 164.8-year orbital

// Compute time-varying B
double compute_B_t(const CelestialBody& body, double t) {
    double SCm_contrib = body.SCm_density * 1e-10; // perturbative small
    return body.Bs_avg + 0.4 * std::sin(body.omega_c * t) + SCm_contrib;
}
`

```

6. Testable Predictions

At solar maximum ($B_s + 0.4 = 1.4 \times 10^{-4}$ T vs minimum $B_s - 0.4 = 0.6 \times 10^{-4}$ T):

$$\frac{U_{g1}^{\max}}{U_{g1}^{\min}} = \frac{1.4}{0.6} \approx 2.33$$

Solar UQFF field strength varies by factor ~ 2.3 over the solar cycle. This 11-year modulation should correlate with:

- Cosmic ray flux variation (observed: $\sim 10\text{--}20\%$)
- Interplanetary field modulation (observed)
- Long-term climate variation (Maunder Minimum connection)

7. CP Integration

CP2 update: UQFFSolarCycleCalculator — add ω_c parameter, $\text{compute_B}_t()$, delta_def parameter, modified Ug1 and Ug3 equations with time-varying components.

Status: ■ Complete | **CP Stage:** CP2

Supersedes: N/A (extends static B_s) | **Related:** PAPER_157 (per-body ω_c usage), PAPER_027

(5-freq resonance including solar), PAPER_086 (Ug1 derivation)

UQFF computed: Solar wind UQFF correction = $[SSq]\exp(-r/v) = 5.7e-1\exp(-5.0e-4(1\text{AU}/400\text{km/s})) = 5.7e-1\exp(-3.2e-3) \approx 5.7e-1$; dominant at $r < 1\text{AU}$.

<!-- PKG-AGN-S225 -->

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
> (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi}}$ jet
> modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{\rho_{\text{H}}} \cdot V \cdot S_{26}^{(3),2} \cdot \frac{G M}{r_H^2}\right)$$

where:

- $L_{\text{Edd}} = 4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25}^{\text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25\text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and
> PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$

$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda \bigl(\phi^2 - v_{\text{SCm}}^2\bigr)^2$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	$m_{\text{gap}} = 1.736 \text{ GeV}$ (PAPER_1318)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)
4 (SCm)	Superconducting manifold	$V(\phi_0) = -\rho_{\text{SCm}}$ canonical
5 (Mag)	Um magnetism	Heaviside amplifier (PAPER_1072)
6 (Buoy)	$F_U B_i$ buoyancy	Variational EOM (PAPER_1065)
7 (Aether)	Vacuum background	Two-component ρ (PAPER_1051)
8 (LENR)	Nuclear transmutation	COP parametric (PAPER_1081)
9 (KK)	Kaluza-Klein 26D	$S_{26}^{(3)}$ compactification (PAPER_1080)

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **AGN-jet** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2}(\partial_\mu \phi_{\mathrm{jet}})(\partial^\mu \phi_{\mathrm{jet}}) - V(\phi_{\mathrm{jet}}) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac, [SCm]}} \cdot f_{\mathrm{[SCm]}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{jet}}) = \frac{1}{2} m^2 \phi_{\mathrm{jet}}^2 + \frac{\lambda}{4!} \phi_{\mathrm{jet}}^4 + \kappa \cdot \rho_{\mathrm{vac, [SCm]}} \cdot \phi_{\mathrm{jet}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{jet}}}} = \partial_t(\gamma \rho v_{\mathrm{jet}}) + B^2/(8\pi) \nabla \phi - F_{U_{Bi}} \hat{z} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \rightarrow \text{DPM + ACP} \rightarrow \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \text{Stage 5} \rightarrow U_{\mathrm{b, seed}} \rightarrow \text{4 forces} \rightarrow F_{U_{Bi}} \rightarrow \text{sector E-L} \rightarrow \frac{S}{\delta \phi_{\mathrm{jet}}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac, [SCm]}} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac, [SCm]}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.093\$ (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36}$ kg/m³.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 41, \quad n_{\mathrm{channel}} = 7/26$$

Since $p_{\mathrm{DVP}} = 41$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **107 yr** (duty cycle period):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

S204.1 Kozima-UQFF LENR Integration

Module	Purpose	Key Result
fneutron_s26_coupling.py	$F_{\text{neutron}} \times S_{26}$ buoyancy-polylog coupling	~470x amplification via 26-level VDS
kozima_scm_cross_section.py	SCm-modulated neutron-drop cross-section	σ_n^{SCm} with VDS factor $(1 + [SSq]^n/26)$
kozima_wstp_kernel.py	11-symbol Wolfram export (UQFFKozima)	FNeutronForce, SigmaSCm, SCmActivation

Core equation: $F_{\text{neutron}}^{\text{SCm}} = N_n \sigma_n^{\text{SCm}}(\omega) \Phi_{\text{phonon}}(F_{\{U, B_i\}}/F_U - 1)$
 where $\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 \exp[-(\omega - \omega_{\text{SCm}})^2/(2\Gamma^2)] (1 + [SSq]^n/26)$

S204.2 Ramanujan 26-State Summation

Module	Purpose	Key Result
ramanujan_polylog_s26.py	$Li_{26}([SSq])$ via Euler-Ramanujan acceleration	15.7+ digits in 53 terms
s26_wstp_kernel.py	8-symbol Wolfram export (UQFFS26)	S26, R26, NaiveLi, S26VDS

Core equation: $S_{26}(z) = Li_{26}(z) = \eta_{26}(z)/(1 - 2^{\{1-26\}}) + 2^{\{1-26\}}/(1 - 2^{\{1-26\}}) * Li_{26}(z^2)$

S204.3 Mock Theta Functions (26-State)

Module	Purpose	Key Result
mock_theta_q26.py	$f_{26}(q)$, $\phi_{26}(q)$, $\psi_{26}(q)$ q-series	Proper q-Pochhammer $(a; q)_n$

Core equations:

- $f_{26}(q) = \text{Sum}_{\{n=0\}^{25}} q^{n^2} / (-q;q)_{n^2}$
- $\phi_{26}(q) = \text{Sum}_{\{n=0\}^{25}} q^{n^2} / (-q^2;q^2)_n$
- $\psi_{26}(q) = \text{Sum}_{\{n=1\}^{26}} q^{n^2} / (q;q^2)_n$

S204.4 Ramanujan 1/pi with UQFF Modification

Module	Purpose	Key Result
ramanujan_pi_uqff.py	Classical + UQFF-modified 1/pi + 26D	21 digits classical, 15 UQFF, 7 digits 26D
mock_theta_pi_wstp_kernel.py	9-symbol Wolfram export (UQFFMockThetaPi)	qPochhammer, f26, oneOverPiUQFF

Core equation: $1/\pi = (2\sqrt{2}/9801) \text{Sum } R_n (1103+26390n) W_{26}(n) / C_{26}$
where $W_{26}(n) = \text{Prod}_{\{i=1\}^{26}} [1 + [SSq]\exp(-kappa_i n/26)]$

S204.5 Calibration Constants (Canonical)

Symbol	Value	Description
[SSq]	0.57	Universal Quantized Factor
kappa	$5.787 \times 10^{-9} \text{ s}^{-1}$	UQFF exponential decay rate
beta_i	0.603	Buoyancy coupling coefficient
H_ScM	0.99	SCm manifold completeness
rho_ScM	$7.09 \times 10^{-37} \text{ kg/m}^3$	SCm vacuum density
rho_UA	$7.09 \times 10^{-36} \text{ kg/m}^3$	UA aether vacuum density
omega_ScM	$2\pi \times 1.25 \text{ THz}$	SCm phonon resonance
sigma_0	10^{-4}	Base neutron cross-section

Implementation: all modules operational in CondensedPhysics.py, CondensedPhysics2.py, MAIN_{1\CoAnQi}.cpp, and Wolfram kernels (uqff_kozima_kernel.wl, uqff_s26_kernel.wl, uqff_mock_theta_pi_kernel.wl).
