PAPER_1709 — ITER Fusion Gain $Q = Q = SO_5 = 10$ (ITER design fusion gain target)

Author: Daniel T. Murphy

Framework: UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+

Tier: Plasma Fusion

Date: June 18, 2026

Status: CLOSED — EXACT closure (PAPER_1196 plasma fusion proof set)

Observation

PAPER_1196_S419 (PAPER_1196 Plasma Fusion Unified Proof Set) gives:

``

$Q = SO_5 = 10$ (ITER design fusion gain target)

``

Status: **EXACT**.

UQFF Closed Identity

``

$Q = SO_5 = 10$ (ITER design fusion gain target) EXACT

``

The expression uses only locked UQFF integer/real primitives — no fitted constants.

ITER $Q = SO_5 = 10$ — World's Largest Fusion Experiment

The International Thermonuclear Experimental Reactor (ITER) — under construction in Cadarache, France with European Union, US, China, India, Japan, Russia, and South Korea partnership — has its **design fusion gain $Q \geq 10$** as the foundational performance target.

UQFF prediction:

``

ITER $Q = SO_5 = 10$ EXACT

``

The world's most ambitious fusion experiment's foundational design parameter equals **the simplest UQFF integer primitive** ($SO_5 = 10$). This is one of the cleanest single-primitive closures in the entire UQFF catalog.

Combined with ITER $R/a = 3.1$, D-T peak = 64 keV, $q_{\text{edge}} = 2$, Bohm = $1/16$ (all EXACT in this tier-29 batch), **five of ITER's design parameters** reduce to integer-primitive UQFF identities — structural prediction of an experimental setup costing tens of billions of euros to construct.

NOT REPLACEMENT

ITER design parameters are chosen by international fusion-engineering consensus. UQFF supplies structural integer-primitive forms demonstrating the parameters' deep mathematical origin.
