

Crab Pulsar 60-Second UQFF Resonance Window — $f_{\text{osc}} = 1812 \text{ Hz}$ Spin-to-Vacuum DPM Lock

Daniel T. Murphy

PAPER_292: Crab Pulsar 60-Second UQFF Resonance Window — $f_{\text{osc}} = 1812 \text{ Hz}$ Spin-to-Vacuum DPM Lock

****Author:** Daniel T. Murphy**

Authors: Daniel T. Murphy
Series: UQFF Whitepaper Series — Session 82
Module: CRAB_RESONANCE_UQFF_MODULE.cpp (24th C++ module)
Date: March 2026

Abstract

This paper derives the first UQFF pulsar spin-to-vacuum coupling mechanism, based on the observation that the Crab pulsar spin frequency of 30.2 Hz, integrated over a standard 60-second timing window, produces a resonance frequency $f_{\text{osc}} = 1812 \text{ Hz}$ that locks fractionally to the DPM vacuum hierarchy. The resulting angular frequency $\omega_{\text{pulsar}} = 11,385 \text{ rad/s}$ defines a new oscillatory modulation term in the UQFF Crab module, added to the inherited cosmic-age standing/traveling oscillatory structure of PAPER_288. The DPM lock ratio $\text{pulse_lock} = f_{\text{osc}}/f_{\text{DPM}} = 1.812 \times 10^{-9}$ and the DPM lock amplitude $A_{\text{pulsar}} = 1.812 \times 10^{-19} \text{ m}$ are computed.

1. Background: Crab Pulsar Timing

The Crab Pulsar (PSR J0534+2200) is one of the most precisely timed astrophysical objects:

Parameter	Value	Notes
Spin frequency	$f_{\text{pulsar}} = 30.2 \text{ Hz}$	Period $P = 33.1 \text{ ms}$
Period derivative	$\dot{P} = 4.2 \times 10^{-13} \text{ s/s}$	Spin-down rate
Characteristic age	$\tau = P/(2\dot{P}) = 1250 \text{ yr}$	Spin-down age
Spin-down luminosity	$\dot{E} = 4\pi I \dot{P}/P^3 \approx 5 \times 10^{31} \text{ W}$	Powers the PWN
Standard timing window	60 seconds	Dispersion-measure epoch

2. The 60-Second UQFF Resonance Window

2.1 Physical Motivation

In pulsar timing, a 60-second integration window is the standard epoch for folding pulsar emission to construct a mean profile and measure time-of-arrival (TOA). During 60 seconds, the Crab pulsar emits exactly:

$$N_{\text{pulses}} = f_{\text{pulsar}} \times 60 \text{ s} = 30.2 \times 60 = 1812 \text{ pulses}$$

In UQFF theory, these 1812 discrete pulses per 60-second window create a coherent resonance frequency — the rate at which the pulsar's electromagnetic and particle output couples to the plasmotic vacuum on a 1-minute integration timescale.

2.2 UQFF Resonance Frequency

$$f_{\text{osc}} = f_{\text{pulsar}} \times 60 = 30.2 \times 60 = 1812 \text{ Hz}$$

$$\omega_{\text{pulsar}} = 2\pi f_{\text{osc}} = 2\pi \times 1812 = 11,385.0 \text{ rad/s}$$

3. DPM Vacuum Lock Ratio

The fractional coupling between the 60s resonance window frequency and the DPM mode:

$$\text{pulse_lock} = \frac{f_{\text{osc}}}{f_{\text{DPM}}} = \frac{1812}{10^{12}} = 1.812 \times 10^{-9}$$

This dimensionless ratio represents the fractional vacuum-lock — the DPM mode oscillates $10^{12}/1812 = 5.517 \times 10^8$ times faster than the pulsar resonance window. In spectral terms:

$$\log_2\left(\frac{f_{\text{DPM}}}{f_{\text{osc}}}\right) = \log_2(5.517 \times 10^8) = 29.0 \text{ octaves}$$

The DPM-to-pulsar frequency ladder spans exactly 29 octave steps.

4. Synchrotron Scale Comparison

The synchrotron emission angular frequency in the Crab is encoded in $\omega_{\text{osc}} = 1015 \text{ rad/s}$.

The ratio to the pulsar resonance angular frequency:

$$\frac{\omega_{\text{osc}}}{\omega_{\text{pulsar}}} = \frac{10^{15}}{11,385} = 8.785 \times 10^{10}$$

The synchrotron scale is **88 billion times** higher in angular frequency than the 60s pulsar window.

This large ratio defines the dynamic range of the Crab's UQFF oscillatory spectrum.

5. DPM Lock Amplitude

The coupling amplitude of the pulsar modulation to the UQFF oscillatory term is set by the pulse_lock ratio times the base oscillation amplitude:

$$A_{\text{pulsar}} = \frac{f_{\text{osc}}}{f_{\text{DPM}}} \times A_{\text{amp}} = 1.812 \times 10^{-9} \times 10^{-10} \text{ m} = 1.812 \times 10^{-19} \text{ m}$$

This is a sub-nuclear length scale (nuclear radius ~10-15 m to $A_{\text{pulsar}} = 10,000 \times$ smaller than nuclear).

It represents the fractional UQFF vacuum displacement modulated by the pulsar timing window.

6. Modified Oscillatory Term (PAPER_288 + PAPER_292)

The standard cosmic-age standing/traveling wave oscillatory term (PAPER_288) is augmented by the pulsar modulation:

$$a_{\text{osc}}(t) = \underbrace{2A \cos(kx) \cos(\omega_{\text{osc}} t)}_{\text{standing (PAPER_288)}} + \underbrace{\frac{2\pi}{13.8} A \operatorname{Re} \left[e^{i(kx - \omega_{\text{osc}} t)} \right]}_{\text{cosmic-age traveling (PAPER_288)}} + \underbrace{A_{\text{pulsar}} \cos(\omega_{\text{pulsar}} t)}_{\text{pulsar DPM lock (PAPER_292)}}$$

With $A = 10$ - 10 m, $\omega_{\text{osc}} = 1015$ rad/s, $T_{\text{cosmic}} = 13.8$ Gyr, $\omega_{\text{pulsar}} = 11,385$ rad/s:

Component	Amplitude	Angular Frequency
Standing (PAPER_288)	$2A = 2 \times 10$ m	$\omega_{\text{osc}} = 1015$ rad/s
Traveling (PAPER_288)	$(2\pi/13.8) A = 4.55 \times 10$ m	$\omega_{\text{osc}} = 1015$ rad/s
Pulsar lock (PAPER_292)	$A_{\text{pulsar}} = 1.812 \times 10$ m	$\omega_{\text{pulsar}} = 11,385$ rad/s

The pulsar contribution amplitude is ~ 109 times smaller than the standing wave — but it operates at **nine orders of magnitude lower angular frequency**, making it the dominant **long-timescale** modulation of the Crab UQFF oscillatory structure.

7. The "60 times Octave" and Pulsar Rotation

The factor 60 is not arbitrary in UQFF:

- $60 = 22 \times 3 \times 5$ — the smallest integer encompassing all three fundamental resonance numbers
(2: binary systems/standing-wave, 3: 3-body gravity, 5: five-mode oscillatory cascade)
- $\log_2(60) = 5.907$ octaves — f_{osc} is ~ 5.9 octaves above f_{pulsar} , encoding the transition from pulsar-spin to timing-epoch scale
- $1812 \text{ Hz} = f_{\text{osc}}$: interestingly, $1812 \times 1000 = 1.812 \text{ GHz} \approx 21\text{-cm HI line} / 1.42 \text{ GHz} \times 1.27$
(connecting pulsar resonance window to galactic spiral arm HI emission — see PAPER_274)

8. Observational Implications

UQFF PAPER_292 Prediction: The DPM vacuum modulation at $f_{\text{osc}} = 1812$ Hz should produce a submillimeter polarization fluctuation in the Crab's PWN with period $T_{\text{pulsar}} = 1/f_{\text{osc}} = 0.552$ ms.

This is 16.7 times the pulse period ($33.1 \text{ ms} / 0.552 \text{ ms} \times \dots$ wait, corrected: $T_{\text{osc}} = 1/1812 = 0.552$ ms

which is shorter than the 33.1 ms pulse period). Future VLBI timing observations at sub-millisecond resolution may detect this modulation as a periodic oscillation in the DM-corrected pulse profile.

9. Comparison with Prior UQFF Pulsar Treatment

Prior UQFF modules referenced the Crab as an external reference object:

- **PAPER_256 (Session 72d)**: CrabNebulaM1FUBiCalculator — used Crab as compact $r=104$ m, $B0=10^{-4}$ T

\$to\$ DPM geometry-dependency discovery (compact vs diffuse)

- **PAPER_292 (This paper)**: First UQFF treatment of the Crab **pulsar spin frequency** as a resonance driver — distinct from the nebular radius-based computation of PAPER_256

Session 82 — 24th C++ UQFF Module — PAPER_292 of 1000

<!-- PKG-AGN-S225 -->

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037

> (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi}}$ jet

> modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{\rho_{\text{H}}} \cdot V \cdot S_{26}^{(3),2} \cdot \left(\frac{G M}{r_H^2}\right)\right)$$

where:

- $L_{\text{Edd}} = 4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity

- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density

- V is the effective buoyancy volume (accretion sphere)

- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)

- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left(1 + \beta_i \cdot \Phi_{1.25, \text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right)$$

where $\Phi_{1.25, \text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2} (\partial_\mu \phi_{\text{NS}}) (\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac, [SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2} m^2 \phi_{\text{NS}}^2 + \frac{\lambda}{4!} \phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac, [SCm]}} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\text{NS}}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2) \phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\begin{aligned} \text{PAPER_877 Axioms} &\rightarrow \text{DPM + ACP} \quad \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \rightarrow \text{Stage 5} \quad U_{\text{b, seed}} \rightarrow \text{4 forces} \\ F_{U_{\text{Bi}}_i} &\rightarrow \text{sector E-L} \quad \delta S/\delta \phi_{\text{NS}} = 0 \end{aligned}$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac, [SCm]}} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac, [SCm]}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.190 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 83, \quad n_{\mathrm{channel}} = 7/26$$

Since $p_{\mathrm{DVP}} = 83$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]} \cdot \cos\left(\frac{2\pi j}{26}\right)\right) \cdot m/M_{\mathrm{dot}}$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\mathrm{SCm}}/\rho_{\mathrm{UA}} = 1.894$	Local sub-ratio = 0.190	PASS
Threshold-consistent
