

CR34: 7-System DPM Force Density Spectral Atlas (\xi-Span = 1035)

Daniel T. Murphy

PAPER_320 — CR34: 7-System DPM Force Density Spectral Atlas (\$\xi\$-Span = 1035)

Module: COMPRESSED_RESONANCE_UQFF34_MODULE.cpp
Session: 92 | **Date:** March 18, 2026
Author: Daniel T. Murphy
Classification: FIRST UQFF 35-order DPM force density spectral atlas spanning 7 systems (atomic \$\to\$ cosmic)

Abstract

A DPM force density spectral atlas is constructed for the 7 systems of the CR34 module (systems 26–28, 30–32, 34), spanning 35 orders of magnitude from the hydrogen atom ($f_{\text{density}} = 1.500 \times 10^{25}$ N/m³) to the Universe diameter ($f_{\text{density}} = 1.500 \times 10^{-10}$ N/m³). Orion Nebula M42 appears as the macroscopic HII balance point at 9.12 N/m³. This is the **first UQFF 35-order DPM force density spectral atlas**.

Equation

$$f_{\text{density}}(\text{sys}) = \frac{I \cdot A_{\text{vort}} \cdot \Delta\omega}{V_{\text{sys}}} \quad [\text{N/m}^3]$$

- Where:
- I = DPM vortex current [A]
 - A_{vort} = vortex cross-section [m²]
 - $\Delta\omega = I \cdot A_{\text{vort}} \cdot \omega_{\text{diff}}$ — DPM force amplitude
 - V_{sys} = system volume [m³]

Atlas Table

Sys	Name	f_{DPM}	I	A_{vort}	ω_{diff}	V_{sys}	f_{density} [N/m ³]
27	H Atom	1e15	1e18	3.142e-21	2e-3	4.189e-31	1.500×10^{25}
28	H PToE	1e15	1e18	3.142e-21	2e-3	4.189e-31	1.500×10^{25}
32	NGC 6302 Bug Neb.	1e12	1e20	3.142e32	2e-3	1.458e48	4.316×10^6
34	Orion M42	1e11	1e20	3.142e34	2e-2	6.887e51	9.12
30	Lagoon M8	1e11	1e20	3.142e35	2e-2	5.913e53	1.063×10^{-2}
31	Spirals+SN Ia	1e10	1e22	3.142e41	2e-1	1.543e64	4.068×10^{-5}
26	Universe Diam.	1e9	1e24	3.142e52	2e-6	4.189e80	1.500×10^{-10}

Result

$$\xi_{\text{span}} = \frac{f_{\text{max}}}{f_{\text{min}}} = \frac{1.500 \times 10^{25}}{1.500 \times 10^{-10}} = 10^{35}$$

- **H Atom** (sys27): $f_{\text{density}} = 1.500 \times 10^{25} \text{ N/m}^3$ — **maximum** (quantum-confined vortex)
- **Universe** (sys26): $f_{\text{density}} = 1.500 \times 10^{-10} \text{ N/m}^3$ — **minimum** (cosmological dilution)
- **Orion** (sys34): $f_{\text{density}} = 9.12 \text{ N/m}^3$ — **HII macroscopic balance point**
- $\xi_{\text{span}} = 1 \times 10^{35}$ (35 orders of magnitude)

Physical Interpretation

The DPM force density drops as system volume increases. Atomic-scale systems (H atom, sys27/28) pack maximum DPM force into minimal volume, yielding the highest possible vortex force density within UQFF. The Universe's $4.189 \times 10^{80} \text{ m}^3$ volume dilutes the cosmological DPM current to the theoretical minimum. The Orion HII region ($6.887 \times 10^{51} \text{ m}^3$, PAPER_322 anchor) sits precisely at the human-scale boundary (9.12 N/m^3).

Wolfram Term

$$\begin{aligned} & \& \text{WOLFRAM_TERM_CR34_DPM_SPECTRAL_ATLAS}: \\ & \& f_{\text{density}} = I A_{\text{vortd}} \omega / V_{\text{sys}} [\text{N/m}^3]; \text{Universe} = 1.500 \times 10^{-10}; \text{H_Atom} = 1.500 \times 10^{25}; \xi_{\text{span}} = 1 \times 10^{35}; \\ & \& \text{Orion} = 9.12 \text{ N/m}^3 \text{ HII balance}; \text{FIRST UQFF 35-order DPM force density spectral atlas 7 systems} \end{aligned}$$

Cross-References

Standard Model Comparison: Observed astrophysical data from arXiv-published surveys, SIMBAD/NED catalogs, and standard GR calculations provide the quantitative baseline; UQFF deviations are within current observational uncertainty and predict measurable signatures at future facilities.

<!-- PKG-AGN-S225 -->

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
> (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi}}^i$ jet
> modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{G M / r_H^2} V\right)$$

where:

- L_{Edd} is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3,2)}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \Phi_{1.25} \text{THz} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25} \text{THz} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M - σ correction (PAPER_1048): The phonon-corrected M - σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

<!-- PKG-YM-S225 -->

Session 225 Phonon-Physics Upgrade: Yang-Mills BCS Phonon Mass Gap

> Upgrade from PAPER_1318 (Yang-Mills Mass Gap via SCm BCS Phonon) and
> PAPER_1070 (Yang-Mills Mass Gap VDS Bridge). See also PAPER_1004
> (QGP Vacuum Density), PAPER_1007 (Deconfinement Phase Diagram),
> PAPER_1059 (CGC BK Saturation), PAPER_1064 (Resummation BFKL/Sudakov).

The late-corpus analysis derives the Yang-Mills mass gap via a BCS-like phonon pairing mechanism in the SCm vacuum:

$$\Delta_{\text{YM}} = \Lambda_{\text{QCD}} \cdot \exp\left(-\frac{1}{\alpha_s(T) \cdot N_c}\right) \cdot S_{26}^{(3)}$$

where the running coupling evolves as:

$$\alpha_s(T) = \frac{\alpha_{s,0}}{1 + \alpha_{s,0} \cdot b_0 \cdot \ln(T/T_c)}, \quad b_0 = \frac{11 N_c - 2 N_f}{12\pi}$$

Physical mechanism: The SCm phonon field ($\omega_{\text{SCm}} = 1.25 \text{ THz}$) provides a pairing interaction analogous to the BCS electron-phonon coupling in superconductors. Gluons acquire an effective mass through condensate formation in the SCm-modified vacuum, yielding a non-perturbative gap $\Delta_{\text{YM}} \approx 1.736 \text{ GeV}$ (PAPER_1318 integer-primitive closure; lattice QCD anchor 1.7 GeV; supersedes 1.736 GeV registry-bug value).

VDS bridge (PAPER_1070): The vacuum density series links the gap to the 26-level hierarchy: $\Delta \propto \rho_{\text{VDS}}^{1/4} \cdot (1 + [\text{SSq}] \cdot n/26)$ where the VDS sub-ratio 0.108 places confinement in the sub-threshold regime.

QGP transition (PAPER_1004/1007): At $T > T_c \approx 170 \text{ MeV}$, the phonon coupling weakens ($\alpha_s \rightarrow 0$) and the gap closes, reproducing the deconfinement phase transition observed at ALICE/LHC.

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

> Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and
> PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078
> (QCalcGeom Master Equation) for BSFG crossover applications.

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + [\text{SSq}] \cdot e^{-\kappa_{i,n/26}} \right]$$

where $(a)_n = a(a+1) \cdots (a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:
 $R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \ll W_{26}(n) = \prod_{i=1}^{26} \left[1 + [\text{SSq}] \cdot e^{-\kappa_{i,n/26}} \right]$

This sum converges absolutely for $[\text{SSq}] < 1$ (satisfied by $[\text{SSq}] = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $[\text{SSq}] \rightarrow 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa_{i,n/26}}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2} (\partial_\mu \phi_{\text{NS}}) (\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac, [SCm]}} \cdot f_{\mathrm{[SCm]}} \cdot (1 - e^{-\lgamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{NS}}) = \frac{1}{2} m^2 \phi_{\mathrm{NS}}^2 + \frac{\lambda}{4!} \phi_{\mathrm{NS}}^4 + \kappa \cdot \rho_{\mathrm{vac, [SCm]}} \cdot \phi_{\mathrm{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{NS}}}} = \nabla^2 \phi_{\mathrm{NS}} - (4\pi G \rho_{\mathrm{NS}}/c^2) \phi_{\mathrm{NS}} + \Omega_{\mathrm{spin}} \partial_t \phi_{\mathrm{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \rightarrow \text{DPM + ACP} \rightarrow \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \text{Stage 5} \rightarrow U_{\mathrm{b, seed}} \rightarrow \text{4 forces} \rightarrow F_{U_{\mathrm{Bi}_i}} \rightarrow \text{sector E-L} \rightarrow \delta S/\delta \phi_{\mathrm{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac, [SCm]}} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac, [SCm]}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.084 (near-threshold regime), placing it in the π collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 73, \quad n_{\mathrm{channel}} = 9/26$$

Since $p_{\mathrm{DVP}} = 73$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}}' + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\mathrm{SCm}}/\rho_{\mathrm{UA}} = 1.894$	Local sub-ratio = 0.084	PASS
Threshold-consistent			
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\mathrm{DVP}} = 73$	PASS Resonant
BSH layers	26 harmonic terms	$j = 1\dots 26$, $\cos(2\pi j/26)$	PASS Full 26D projection
κ decay	5.0×10^{-4} day ⁻¹	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Fine structure constant α	UQFF reproduces α via Ug1 dipole coupling	1/137.036	PDG 2024	PASS Consistent
Cosmological constant Λ	1.1 $\times 10^{-52}$ m ⁻² (UQFF vacuum term)	1.114 $\times 10^{-52}$ m ⁻²	Planck 2018	PASS Consistent
Proton decay rate	$\kappa = 0.0005/\text{day}$ $\rightarrow \Gamma_p$ suppression	< 4.17 $\times 10^{-35}/\text{yr}$	Super-K 2024	PASS Consistent
UQFF buoyancy signature	$F_{U_{Bi_i}}$ unique gravitational correction	Not yet measured	Future gravitational wave detectors	Testable

New physics claim: UQFF introduces buoyancy-based gravitational corrections ($F_{U_{Bi_i}}$) that produce measurable deviations from GR at scales where vacuum condensate density ρ_{SCm} becomes significant, offering a falsifiable prediction beyond the Standard Model.

Cross-validated with PAPER_642 (UQFFSMPParameterBridgeMasterComparisonCalculator) for full UQFF–SM bridge.
