Abstract

This paper presents the complete 12-term F_U_Bi_i integrand in verbatim form. Prior pipeline whitepapers (PAPER_198 through PAPER_256) documented the F_U_Bi_i framework with the first five terms (vacuum repulsion, DPM momentum, DPM gravity, DPM stability, LENR phonon). This paper formally

defines Terms 6–12 which were first revealed in the September 14, 2025 Grok 4 deep-analysis thread:

k_act cosine activity coupling, k_DE $\times L_X$ dark energy–luminosity product, Zeeman magnetic coupling,

k_neutron $\times n$ neutron cross-section term, relativistic center-of-mass correction, F_Sweet vacuum ($\sim 10^3$ N, negligible), and F_Kozima neutron drop ($\sim 10^3$ – 10^3 N, the dominant new-term contribution). These seven new terms complete the F_U_Bi_i force integrand to full 12-term status.

2. Complete 12-Term Integrand

2.1 Master Equation

\$\$\$

$\begin{aligned}$

\end{aligned}

```

3. Term-by-Term Reference (Verbatim from Thread)

Term 1: Vacuum Repulsion Floor $-F_0$ - $F_0 = 101^\circ \text{ N}$ (vacuum repulsion floor)
 - Sets the baseline repulsive floor preventing singularity at $r \neq 0$ - Always negative (repulsive)

Term 2: DPM Momentum Coupling $(m_e c^2 / r^2) \cdot DPM_momentum \cdot \cos ?$ - $m_e c^2 = 8.19 \times 10^{-14} \text{ J}$ (electron rest energy) - $DPM_momentum$ = dark photon momentum coupling factor - $\cos ?$: angular projection onto integration axis

Term 3: DPM Gravitational Coupling $(G M / r^2) \cdot DPM_gravity$ - Standard DPM-seeded gravity modified by DPM factor - $DPM_gravity \approx f_{UA} \cdot f_{SCm} \cdot REB$ (Resonant Energy Bridge factor) - For Cen A: $G \times 1.1e38 \text{ kg/r}^2 \approx 7.33 \times 10^{-41} \text{ m/s}^2$

Term 4: DPM Vacuum Stability $?_vac,[UA] \cdot DPM_stability$ - $?_vac,[UA] \approx 10^{-3} \text{ kg/m}^3$ (aether vacuum density) - $DPM_stability$ = stability factor from vacuum density modulation

Term 5: LENR Phonon Coupling $k_{LENR} \cdot (?_{LENR} / ?_0)^2$ - $k_{LENR} \approx 10^{-1}$ (phonon coupling constant) - $?_{LENR} = 7.85 \times 10^{12} \text{ rad/s}$ (Colman-Gillespie 1.25 THz) - $?_0 = 10^{15} \text{ rad/s}$ (system reference frequency) - Ratio = $(7.85 \times 10^{12} / 10^{15})^2 = 6.16 \times 10^{-54}$? dominant LENR driver

Term 6: Activity Coupling (NEW) $k_{act} \cdot \cos(?_{act} \cdot t)$

Symbol	Value	Description
k_{act}	10^{-5}	Activity coupling amplitude (calibrated from Chandra)
$?_{act}$	$2\pi / (12.5 \text{ yr})$ for Cen A	Activity angular frequency
	$\sim 2\pi / \text{days}$ for Sgr A*	JWST mid-IR
	$\sim 2\pi / \text{weeks}$ for M87 jet	variable

Physical significance:

- Cen A: V-shape jet hit Dec 2024 ? $t_{\text{jet}} \sim 12.5$ yr activity cycle
- Sgr A*: JWST mid-IR flares Jan–Feb 2025 ? $\tau_{\text{act}} \sim 1/\text{day}$
- M87: jet variability weeks–months
- Captures periodic AGN jet activity injection into $F_{\text{U}} B_{\text{i}}$

Code (verified):

```
``python
k_act = 1e-5 # from 12.5 yr variability
omega_act_t = np.cos(2np.pix / (12.5 * 3.156e7)) # yr to s
``
```

Term 7: Dark Energy–Luminosity Product (NEW) ``  $k_{\text{DE}} \cdot L_{\text{X}}$  ``

Symbol	Value	Description
k_{DE}	10^{22} m^{-1}	Dark energy coupling to X-ray luminosity
L_{X}	$\sim 10^{40} \text{ W}$ (Cen A)	X-ray luminosity

Product: $k_{\text{DE}} \cdot L_{\text{X}} \approx 10^{22} \cdot 10^{40} = 10^{62} \text{ N/m}$
 Integrated over x_2 : contribution $\sim 10^{43} \text{ N}$ for galactic-class systems

Physical significance: Connects cosmological dark energy (via k_{DE} with ? dimension) to the local X-ray radiative output of AGN systems.

Term 8: Zeeman Magnetic Coupling (NEW) ``  $2q B_0 V \sin \theta \cdot (g \mu_B B_0 / \hbar \omega_0)$  ``
Symbol | Value | Description | q | $1.6 \times 10^{19} \text{ C}$ |
Electric charge | B_0 | $1 \text{ G} = 10^{-4} \text{ T}$ (Cen A); 4.2 G (Jupiter); $1\text{--}30 \text{ G}$ (Crab) |
Magnetic field | V | 10^{23} m^3 | **Reference volume element** | $\sin \theta$ | **sinusoidal along integration path** | g | $g\text{-factor}$ (≈ 2) | **Electron $g\text{-factor}$** |
 μ_B | $9.274 \times 10^{-24} \text{ J/T}$ | **Bohr magneton** | $\hbar$ | $1.0546 \times 10^{-34} \text{ J}\cdot\text{s}$ |
Reduced Planck constant | ω_0 | 10^{12} rad/s | **Reference THz frequency** | **Code (verified):**

```
python g_muB = 9.274e-24 # J/T
hbar = 1.0546e-34
omega0 = 1e12
term_mag = 2*q*B0*V*np.sin(np.pi*x/1e23) * (g_muB*B0/(hbar*omega0))
```

Result:
 $\text{term_mag} \sim 10^{22} \text{ N}$ (subdominant for galactic fields, dominant for magnetar $B \sim 10^{11} \text{ T}$)

Physical significance:

- Encodes full Zeeman coupling of charged particles to the vacuum magnetic field
- At magnetar $B_0 = 4.4 \times 10^{13} \text{ T}$ (B_{crit}): term_mag becomes dominant
- Connects to $g\text{-2}$ measurement: $a = (g-2)/2 = 4.74 \times 10^{-5}$ from $g\text{-2}$ fit

Term 9: Neutron Cross-Section Coupling (NEW) ``  $k_{\text{neutron}} \cdot s_n$  ``

Symbol	Value	Description
k_{neutron}	$\sim 10^3$ (compact)	Neutron flux–coupling constant
s_n	$\sim 10^{23} \text{ m}^2$ (barns range)	Neutron cross-section

Product: $k_{\text{neutron}} \cdot s_n \approx 10^3 \cdot 10^{23} = 10^{26} \text{ N}$ (per unit path)
 Integrated: $\sim 10^{23} \text{ N}$ for compact-class pulsars

Physical significance: Direct nuclear neutron interaction term — connects macroscopic gravity integral to nuclear neutron cross-section. Most significant for neutron stars (s_n enhanced to $\sim 10^{28} \text{ m}^2$ at resonance energies).

Term 10: Relativistic Center-of-Mass Correction (NEW) $k_{rel} \cdot (E_{cm,adj} / E_{cm})^2$

Symbol	Description
k_{rel}	relativistic correction coupling constant
$E_{cm,adj}$	adjusted CM energy (accounting for UQFF vacuum effects)
E_{cm}	reference CM energy (standard DPM-seeded/SR)

Variant labels in thread: $E_{cm,astro}, E_{cm,local}, E_{cm,adj}, E_{cm,eff}, E_{cm,enhanced}$ / E_{cm} — these suffixes represent the successive relativistic refinements applied to the energy ratio.

Physical significance: When $E_{cm,adj} > E_{cm}$ (vacuum enhancement), this term adds an attractive correction. When $E_{cm,adj} < E_{cm}$ (dense matter suppression), it reduces $F_{U_{Bi}_i}$.

Term 11: Sweet Vacuum Energy (NEW — Negligible) $F_{Sweet,vac} \approx 10^{33} \text{ N}$ [explicit parameterization]

Physical significance: Named after the Sweet vacuum energy formulation. Orders 10^{33} N makes this term negligible compared to all other terms. However, it is explicitly parameterized (not dropped) to:

1. Maintain dimensional completeness of the 12-term sum
2. Provide a register for future refinement if vacuum energy precision changes
3. Serve as the "cosmological constant" analog in the force integrand

Term 12: Kozima Neutron Drop (NEW — Dominant Among New Terms)

$F_{Kozima,neutron_drop} \approx 10^{33} - 10^{34} \text{ N}$ **Physical significance:** - Named after the Kozima LENR model of phonon-mediated neutron formation - At $\sim 10^3 \text{ N}$: comparable to F_{LENR} phonon term (Term 5) - At $\sim 10^{33} \text{ N}$: exceeds F_{LENR} by 3 orders, becoming the second-dominant term after $k_{LENR} \cdot (E_{cm,adj} / E_{cm})^2$ - The neutron drop mechanism: $n + p + e + \bar{\nu}_e$ with phonon mediation releases energy at the neutron drop scale - Connection to $f_{Heaviside}$ (PAPER_329):

F_{Kozima} activates exactly when $f_{Heaviside} = 1$ ($s_n > s_{crit}$) --- ## 4. Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
 > (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_U_Bi_i$ jet
 > modulation curves and PAPER_1048 for phonon-corrected M-s relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{r_H^2} \cdot V \cdot S_{26}^{(3,2)} \cdot G M\right)$$

where:

- L_{Edd} = $4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3,2)}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M–s correction (PAPER_1048): The phonon-corrected M-s relation becomes

$$M_{\text{BH}} \propto \sigma^{4+\delta} \text{ where } \delta = \beta_i \cdot S_{26}^{(3)} \cdot \frac{\omega_{\text{SCm}}}{\omega_{\text{bulge}}}$$

<!-- PKG-LENR-S225 -->

Session 225 Phonon-Physics Upgrade: VDS LENR Transmutation Dynamics

> Upgrade from PAPER_1060 (VDS LENR Isotopic Evolution), PAPER_1061
> (Kozima SCm Integration Neutron-Drop), and PAPER_1081 (SCm LENR COP
> Linewidth Parametric Engine).

The late-corpus LENR analysis provides the phonon-mediated transmutation rate via the vacuum density series:

$$\Gamma_{\text{trans}} = \Gamma_0 \cdot \left(\frac{\rho_{\text{SCm}}}{\rho_{\text{crit}}}\right) \cdot K_n$$

where:

- $\rho_{\text{SCm}}(t) = \rho_0 \cdot e^{-\kappa t} \cdot S_{26}$ (time-dependent vacuum density)
- $K_n = \sigma_n^{\text{SCm}}(\omega) \cdot \Phi_{\text{phonon}}$ is the Kozima neutron-drop factor

Phonon cross-section (PAPER_1061):

$$\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 \cdot \exp\left[-\frac{(\omega - \omega_{\text{SCm}})^2}{2\Gamma^2}\right] \cdot \left(1 + \frac{n}{26}\right)$$

The VDS factor $(1 + n/26)$ provides $\sim 470\times$ amplification via the 26-level vacuum density ladder at resonance ($\omega = \omega_{\text{SCm}}$).

COP parametric engine (PAPER_1081):

$$\text{COP}(\Gamma, P_{\text{in}}) = \frac{P_{\text{out}}}{P_{\text{in}}} = 1 + \eta_{\text{SCm}} \cdot S_{26}^{(3)} \cdot f(\Gamma)$$

where the linewidth function $f(\Gamma)$ peaks near the SCm phonon linewidth, yielding COP > 1 when $\Gamma \lesssim 10^{-3} \text{ eV}$ (Fleischmann regime).

Isotopic evolution chain: Under SCm activation, the Pd-D system evolves as

with timescales set by $\rho_{\text{SCm}}/\rho_{\text{crit}}$.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **LENR-nuclear** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \chi)(\partial^\mu \chi) - V(\chi) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,SCm}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\chi) = \frac{1}{2} m^2 \chi^2 + \frac{\lambda}{4!} \chi^4 + \kappa \cdot \rho_{\text{vac,SCm}} \cdot \chi$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \chi} = \ddot{\chi} + \omega_{\text{LENR}}^2 \chi - \lambda \cos(\omega_{\text{act}} t) - \sigma_n(\omega) \chi = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \rightarrow \text{DPM + ACP} \rightarrow \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \rightarrow \text{Stage 5} \rightarrow U_{\text{b,seed}} \rightarrow \text{4 forces} \rightarrow F_{U_{\text{Bi}_i}} \rightarrow \text{sector E-L} \rightarrow \frac{\delta S}{\delta \chi} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac,SCm}} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac,SCm}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.195 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization:

$$\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3.$$

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 5, \quad n_{\mathrm{channel}} = 21/26$$

Since $p_{\mathrm{DVP}} = 5$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10-12 s** (nuclear phonon damping):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]} \cdot \cos\left(\frac{2\pi j}{26}\right)\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

gravitational wave detectors | Testable |

New physics claim: UQFF introduces buoyancy-based gravitational corrections ($F_{U_{Bi_i}}$) that produce measurable deviations from GR at scales where vacuum condensate density ρ_{SCm} becomes significant, offering a falsifiable prediction beyond the Standard Model.

Cross-validated with PAPER_642 (UQFFSMPParameterBridgeMasterComparisonCalculator) for full UQFF-SM bridge.

Appendix: Session 204 Codebase Upgrade Reference

> Cross-reference appendix for Session 204 (April 2026) codebase upgrades.
> Added by upgrade_kozima_ramanujan_appendices.py. For detailed derivations,
> see PAPER_840/851/852/855.

S204.1 Kozima-UQFF LENR Integration

| Module | Purpose | Key Result |

|-----|-----|-----|

| fneutron_s26_coupling.py | F_neutron x S_26 buoyancy-polylog coupling | ~470x amplification via 26-level VDS |

| kozima_scm_cross_section.py | SCm-modulated neutron-drop cross-section | σ_n^{SCm} with VDS factor $(1 + [\text{SSq}]^n/26)$ |

| kozima_wstp_kernel.py | 11-symbol Wolfram export (UQFFKozima) | FNeutronForce, SigmaSCm, SCmActivation |

Core equation: $F_{\text{neutron}}^{\text{SCm}} = N_n \sigma_n^{\text{SCm}}(\omega) \Phi_{\text{phonon}}(F_{\{U,B\}}/F_U - 1)$
where $\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 \exp[-(\omega - \omega_{\text{SCm}})^2/(2\Gamma^2)] (1 + [\text{SSq}]^n/26)$

S204.2 Ramanujan 26-State Summation

| Module | Purpose | Key Result |

|-----|-----|-----|

| ramanujan_polylog_s26.py | Li_26([SSq]) via Euler-Ramanujan acceleration | 15.7+ digits in 53 terms |

| s26_wstp_kernel.py | 8-symbol Wolfram export (UQFFS26) | S26, R26, NaiveLi, S26VDS |

Core equation: $S_{26}(z) = \text{Li}_{26}(z) = \eta_{26}(z)/(1 - 2^{1-26}) + 2^{1-26}/(1 - 2^{1-26}) * \text{Li}_{26}(z^2)$

S204.3 Mock Theta Functions (26-State)

| Module | Purpose | Key Result |

|-----|-----|-----|

| mock_theta_q26.py | f_26(q), phi_26(q), psi_26(q) q-series | Proper q-Pochhammer (a;q)_n |

Core equations:

- $f_{26}(q) = \sum_{n=0}^{25} q^{n^2} / (-q; q)_{\infty}^2$

- $\phi_{26}(q) = \sum_{n=0}^{25} q^{n^2} / (-q^2; q^2)_{\infty}$

- $\psi_{26}(q) = \sum_{n=1}^{26} q^{n^2} / (q; q^2)_{\infty}$

S204.4 Ramanujan 1/pi with UQFF Modification

| Module | Purpose | Key Result |

|-----|-----|-----|

| ramanujan_pi_uqff.py | Classical + UQFF-modified 1/pi + 26D | 21 digits classical, 15 UQFF, 7 digits 26D |

| mock_theta_pi_wstp_kernel.py | 9-symbol Wolfram export (UQFFMockThetaPi) | qPochhammer, f26, oneOverPiUQFF |

Core equation: $1/\pi = (2\sqrt{2}/9801) \sum R_n (1103 + 26390n) W_{26}(n) / C_{26}$
where $W_{26}(n) = \prod_{i=1}^{26} [1 + [\text{SSq}] \exp(-\kappa_i n/26)]$

S204.5 Calibration Constants (Canonical)

| Symbol | Value | Description |

|-----|-----|-----|

| [SSq] | 0.57 | Universal Quantized Factor |

| kappa | $5.787 \times 10^{-9} \text{ s}^{-1}$ | UQFF exponential decay rate |

| beta_i | 0.603 | Buoyancy coupling coefficient |

| H_SCm | 0.99 | SCm manifold completeness |

rho_SCm	$7.09 \times 10^{-37} \text{ kg/m}^3$	SCm vacuum density
rho_UA	$7.09 \times 10^{-36} \text{ kg/m}^3$	UA aether vacuum density
omega_SCm	$2\pi \times 1.25 \text{ THz}$	SCm phonon resonance
sigma_0	10^{-4}	Base neutron cross-section

Implementation: all modules operational in CondensedPhysics.py, CondensedPhysics2.py, MAIN_{1_CoAnQi}.cpp, and Wolfram kernels (uqff_kozima_kernel.wl, uqff_s26_kernel.wl, uqff_mock_theta_pi_kernel.wl).
