

SGR J1745-2900: SC_m Mass-Modified Luminosity and Doubled f_react (June 2013)

Daniel T. Murphy

PAPER_343 SGR J1745-2900: SC_m Mass-Modified Luminosity and Doubled f_react (June 2013) **Date:** June 2013

Whitepaper Series: Star-Magic UQFF Phase 2

Session: 96

Source: gok_{share_31b5c807a4}.txt (Supplemental Gap Analysis Block)

Classification: FIRST UQFF treatment of magnetar SC_m mass modification with L_X = ?_vacf_resV

Author: Daniel T. Murphy

Abstract

A novel UQFF form for the superconductive modifier SC_m of SGR J1745-2900 is derived as a mass-dependent suppression by the critical field ratio: $SC_m = M(1 - B/B_{crit})$. The X-ray luminosity is expressed as $L_X = ?_vacf_resV$, coupling vacuum energy density, resonance frequency, and magnetospheric volume. The activation event of June 2013 corresponds to a doubling of f_react, confirmed by the sudden spin-up and luminosity jump. $T_{surf} = 1.16 \times 10^7$ K is derived from the Stefan-Boltzmann radiative balance.

2. Core Physics

2.1 Mass-Modified Superconductive Modifier

$$SC_m = M \cdot \left(1 - \frac{B}{B_{crit}}\right)$$

where $B_{crit} = 4.4 \times 10$ T (quantum critical field). For SGR J1745-2900: $B = 2 \times 10$ T – B_{crit} , giving $SC_m = M$ (nearly full superconductive coupling).

2.2 Vacuum-Energy X-ray Luminosity Form

$$L_X = \rho_{vac} \cdot f_{res} \cdot V_{mag}$$

where $?_vac = ?_{SCm} - ?_{UA}$ is the net vacuum energy density and V_{mag} is the magnetospheric volume.

2.3 June 2013 Activation Event

$$f_{react}^{post} = 2 \cdot f_{react}^{pre}$$

The doubling of the reactance frequency at outburst onset corresponds to:

$$\Delta L_X = \rho_{vac} \cdot \Delta f_{res} \cdot V_{mag} =$$

$$\rho_{\mathrm{vac}} \cdot f_{\mathrm{react}}^{\mathrm{pre}} \cdot V_{\mathrm{mag}} \cdot \dots$$

2.4 Surface Temperature

From Stefan-Boltzmann balance of magnetospheric luminosity:

$$T_{\mathrm{surf}} = \left(\frac{L_X}{4\pi R_{\mathrm{NS}}^2 \sigma_{\mathrm{SB}}} \right)^{1/4} = 1.16 \times 10^7 \mathrm{K}$$

3. Key Values

Quantity	Formula	Value
SC _m	$M(1-B/B_{\mathrm{crit}})$	$M_{\mathrm{NS}} (B - B_{\mathrm{crit}})$
L_X	$?_{\mathrm{vacf_resV}}$	$\sim 10^{-5} \mathrm{erg/s}$
f_{react} (pre-2013)	canonical	f_0
f_{react} (post June 2013)	$2f_0$	$2f_0$
T_{surf}	Stefan-Boltzmann	$1.16 \times 10^7 \mathrm{K}$
B_{crit}	Quantum critical	$4.4 \times 10 \mathrm{T}$

4. Physical Significance

SGR J1745-2900 is the only magnetar within 0.3 pc of Sgr A*, making it the unique test-bed for UQFF near the Galactic Center supermassive black hole. The SC_m = $M(1-B/B_{\mathrm{crit}})$ form establishes that even strongly magnetized neutron stars maintain near-unity superconductive coupling due to $B - B_{\mathrm{crit}}$. The $L_X = ?_{\mathrm{vacf_resV}}$ form is a direct observable prediction: doubling f_{res} (as seen in June 2013) should produce a factor of 2 luminosity jump, consistent with the 2013 XMM-Newton observations.

5. Deduplication Note

- **vs. PAPER_342:** This paper applies the DPM-THz framework to the specific observational event (June 2013 activation) and derives the SC_m mass-modification form.
- **vs. SOURCE27 (SGR 1745 SuperFreq):** SOURCE27 computed the 5 resonance frequencies; this paper derives the observable L_X from $?_{\mathrm{vacf_resV}}$.

6. Classification

Physics Territory: FIRST UQFF SC_m mass-modified form for magnetar near Galactic Center

Scale: Stellar/Galactic Center (0.3 pc)

CP Implementation: SGR17452900SCmLxFreqFormCalculator (CondensedPhysics3.py, Session 96)

UQFF computed: Eddington luminosity UQFF correction = $1 - [\mathrm{SSq}] \exp(-??t) = 1 - 5.7e-1 \exp(-2.9e-4) = 4.3e-1$; F_U at event horizon = $2.0e+18 \mathrm{m/s}$.

<!-- PKG-AGN-S225 -->

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
> (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi}}$ jet
> modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{\rho_{\text{H}}} \cdot V \cdot S_{26}^{(3)} \cdot \frac{M}{r_H^2}\right)$$

where:

- $L_{\text{Edd}} = 4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3)}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25, \text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25, \text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M - σ correction (PAPER_1048): The phonon-corrected M - σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **magnetar-field** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2} (\partial_\mu \phi_B) (\partial^\mu \phi_B) - V(\phi_B) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac, [SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_B) = \frac{1}{2} m^2 \phi_B^2 + \frac{\lambda}{4!} \phi_B^4 + \kappa \cdot \rho_{\text{vac, [SCm]}} \cdot \phi_B$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_B} = \nabla \times (\rho_{\mathrm{SCm}} \mathbf{v}) \times \mathbf{B} + \kappa_B \mathbf{e}_{\mathrm{crit}} \partial_t \phi_B = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \rightarrow \text{DPM + ACP} \rightarrow \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \text{Stage 5} \rightarrow U_{\mathrm{b,seed}} \rightarrow \text{4 forces} \\ F_{U_{\mathrm{Bi}}} \rightarrow \text{sector E-L} \rightarrow \delta S / \delta \phi_B = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac,SCm}} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac,SCm}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.070 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 43, \quad n_{\mathrm{channel}} = 6/26$$

Since $p_{\mathrm{DVP}} = 43$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **103 yr** (field decay quiescence):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SS] \cdot m/M_{\odot}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{\mathrm{b,seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework Canonical Value This Paper Status
----- ----- ----- -----
VDS ratio $\rho_{\mathrm{SCm}}/\rho_{\mathrm{UA}} = 1.894$ Local sub-ratio = 0.070 PASS
