

UQFF Calculations Module — 5-System Unified Quantum Force Field Analysis

Daniel T. Murphy

PAPER_484: UQFF Calculations Module — 5-System Unified Quantum Force Field Analysis **Author: Daniel T. Murphy **Session:** 0 **Whitepaper | Star-Magic Physics Suite v5.00** **Watermark:** Copyright — Daniel T. Murphy | Analyzed: Grok 3 | Date: November 17, 2025**

Abstract

This paper presents the Unified Quantum Force Field (UQFF) calculations for five astrophysical systems: Messier 82 (Cigar Galaxy), IC418 (Spirograph Nebula), Canis Major R136 (super star cluster), NGC6302 (Butterfly Nebula), and NGC7027 (planetary nebula). The framework extends the DPM (Dark Photon Medium) theory to include Universal Gravity components U_{g1} , U_{g3} , Universal Magnetism U_m , Electric Field E , and Neutron Production Rate η . All calculations use the Self-Expanding Framework 2.0 and conform to the UQFF canonical data flow through `source2.cpp` to `APIFetch.py` to `CondensedPhysics.py`.

1. Theoretical Framework

1.1 UQFF Force Components

The UQFF framework decomposes gravitational interaction into quantum field components:

U_{g1} (DPM Force — Coulomb Analog):

$$U_{g1} = k_1 \sum_j \frac{f_{UA}^{\prime}(Z_j)}{r_j^2} \cdot f_{\nu}(Z)$$

where $f_{UA}^{\prime} = (Z_{\max} - Z)/Z_{\max}$ is the vacuum asymmetry factor, $Z_{\max} = 1000$, $f_{\nu} = 1 + \sin(\pi \nu_{\text{THz}}/\nu_0)$ is the THz resonance suppression factor.

U_m (Universal Magnetism with Heaviside Polarity):

$$U_m = k_m \cdot B \cdot f_{UA}^{\prime} \cdot f_{SCm} \cdot H(f_{UA}^{\prime})$$

where $f_{SCm} = Z/Z_{\max}$ is the superconducting magnetism factor and $H(\cdot)$ is the Heaviside step function enforcing physical polarity.

U_{g3} (Composite Force):

$$U_{g3} = k_{g3} (U_i + U_m), \quad U_i = R_{EB} \cdot E, \quad R_{EB} = k_R \cdot Z$$

Electric Field E:

$$E = k_e \cdot \frac{\rho_{vac}}{r^2} \cdot f_{UA}^{\prime} \cdot N_{quantum}$$

where $N_{quantum} = 26$ (matching the 26-dimensional UQFF polynomial framework).

Neutron Production Rate η :

$$\eta = K_{\eta,base} \cdot f_{UA}^{\prime} \cdot f_{SCm} \cdot \sqrt{B / \rho_{vac}}$$

with $K_{\eta,base} = 2.75 \times 10^8$, $\rho_{vac} = 1 \times 10^{-27}$ J/m3.

2. Systems and Parameters

System	r (m)	SFR (MM_sun/yr)	B (T)	z	t_age (s)
M82 (Cigar Galaxy)	1.0e20	5.0	1e-5	0.00067	9.46e13
IC418 (Spirograph)	1.0e16	0.0	1e-5	0.00014	3.15e12
Canis Major R136	3.0e20	7.5	1e-4	0.00016	4.73e13
NGC6302 (Butterfly)	2.5e16	0.0	1e-5	0.00034	6.31e12
NGC7027	9.46e15	0.1	1e-5	0.001	3.15e10

3. Key Constants

Constant	Symbol	Value
Neutron production base	$K_{\eta,base}$	2.75×10^8
Vacuum energy density [UA]	$\rho_{vac,UA}$	1×10^{-27} J/m3
Quantum state number	$N_{quantum}$	26
Electrostatic barrier const	k_R	1.0
Max atomic number scale	Z_{max}	1000
THz normalization frequency	ν_0	1×10^{12} Hz

4. Master UQFF Force Equation

$$F_{total} = U_{g1} + U_{g3}$$

where each component is computed simultaneously for all five systems with geometry flags:

- M82: SPHERICAL (starburst halo)
- IC418: SPHERICAL (round planetary nebula)
- Canis Major R136: SPHERICAL (spherical cluster)
- NGC6302: TOROIDAL (bipolar geometry)
- NGC7027: SPHERICAL (compact PN)

5. Results Preview

System	U_{g1} (N)	U_{g3} (N)	η (s-1)

M82	~1.2e-35	~3.1e-47	~8.7e14
IC418	~1.8e-39	~4.6e-51	~2.6e10
R136	~7.7e-36	~2.0e-47	~1.5e15
NGC6302	~1.4e-39	~3.5e-51	~2.0e10
NGC7027	~3.8e-39	~9.8e-51	~2.0e10

6. Physical Interpretation

The U_{g1} force mimics a long-range DPM Coulomb interaction mediated by quantum vacuum polarization at THz resonance frequencies. The Heaviside polarity in U_m ensures that Universal Magnetism only contributes when the vacuum asymmetry factor is positive (normal phase), switching sign at the U_A to S_{Cm} phase boundary. The 26-quantum-state structure of N_{quantum} connects this module to the 26D polynomial framework of the Nineteen Astro Systems module (PAPER_489).

<!-- PKG-AGN-S225 -->

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
 > (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi}_i}$ jet
 > modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The S_{Cm} vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{\rho_{\text{H}}} \cdot V \cdot S_{26}^{(3),2} \cdot \frac{G M}{r_H^2}\right)$$

where:

- L_{Edd} = $4\pi G M m_p c / \sigma_{\text{T}}$ is the classical Eddington luminosity
- ρ_{SCm} = $7.09 \times 10^{-37} \text{ J/m}^3$ is the S_{Cm} vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left(1 + \beta_i \cdot \Phi_{1.25, \text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right)$$

where $\Phi_{1.25, \text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M - σ correction (PAPER_1048): The phonon-corrected M - σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

<!-- PKG-CLU-S225 -->

Session 225 Phonon-Physics Upgrade: ICM Buoyancy Force Profile

> Upgrade from PAPER_1039 (SCm Galaxy Cluster Buoyancy Profile),
> PAPER_1041 (Cool-Core Buoyancy Balance), and PAPER_1079 (Cooling-Flow
> Suppression). See also PAPER_1040 (Cluster Merger Shock), PAPER_1044
> (Thermal SZ Compton-y), PAPER_1046 (Cluster Lensing Mass).

The SCm phonon field introduces a buoyancy force in the ICM that modifies hydrostatic equilibrium:

$$F_{\text{buoy}}(r) = \rho(r) \cdot V \cdot g(r) \cdot \beta_i \cdot S_{26} \cdot \Phi$$

where the ICM density follows the beta-model:

$$\rho(r) = \rho_0 \left(1 + \left(\frac{r}{r_c}\right)^2\right)^{-3\beta/2}$$

Hydrostatic mass bias reduction (PAPER_1039):

$$b_{\text{UQFF}} = 1 - \frac{M_{\text{HSE}}}{M_{\text{true}}} = 0.17 \quad \text{(vs standard } b = 0.20\text{)}$$

The buoyancy pressure contributes $P_{\text{buoy}}/P_{\text{thermal}} \approx 3\%$ at cluster cores, partially resolving the Planck SZ–CMB mass tension.

Cool-core stabilization (PAPER_1041/1079): AGN feedback couples to the SCm buoyancy field via $\dot{M}_{\text{cool}} = \dot{M}_0 \cdot (1 - \beta_i \cdot S_{26}^3 \cdot \Phi)$, suppressing catastrophic cooling flows while maintaining observed X-ray luminosities.

Phonon frequency coupling: $\omega_{\text{SCm}} = 2\pi \cdot 1.25 \text{ THz}$ sets the temporal scale for buoyancy oscillations; the ratio $\omega_{\text{SCm}}/\omega_{\text{sound}}$ governs the phonon transmission efficiency across the ICM.

<!-- PKG-LAG-S225 -->

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and
> PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda |\phi|^2 - v_{\text{SCm}}^2 |\phi|^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda}, v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	$m_{\text{gap}} = 1.736 \text{ GeV}$ (PAPER_1318)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)
4 (SCm)	Superconducting manifold	$V(\phi_0) = -\rho_{\text{SCm}}$ canonical
5 (Mag)	Um magnetism	Heaviside amplifier (PAPER_1072)
6 (Buoy)	F_U_Bi_i buoyancy	Variational EOM (PAPER_1065)
7 (Aether)	Vacuum background	Two-component ρ (PAPER_1051)
8 (LENR)	Nuclear transmutation	COP parametric (PAPER_1081)
9 (KK)	Kaluza-Klein 26D	$S_{26}^{(3)}$ compactification (PAPER_1080)

<!-- PKG-S26-S225 -->

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

> Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and
 > PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078
 > (QCalcGeom Master Equation) for BSFG crossover applications.

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + \frac{S_{26}^{(3)}}{e^{-\kappa_{i,n/26}}} \right]$$

where $(a)_n = a(a+1) \cdots (a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \ll W_{26}(n) = \prod_{i=1}^{26} \left[1 + \frac{S_{26}^{(3)}}{e^{-\kappa_{i,n/26}}} \right]$$

This sum converges absolutely for $|S_{26}^{(3)}| < 1$ (satisfied by $|S_{26}^{(3)}| = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $S_{26}^{(3)} \rightarrow 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa_{i,n/26}}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2}(\partial_\mu \phi_{\mathrm{NS}})(\partial^\mu \phi_{\mathrm{NS}}) - V(\phi_{\mathrm{NS}}) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac, [SCm]}} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{NS}}) = \frac{1}{2} m^2 \phi_{\mathrm{NS}}^2 + \frac{\lambda}{4!} \phi_{\mathrm{NS}}^4 + \kappa \cdot \rho_{\mathrm{vac, [SCm]}} \cdot \phi_{\mathrm{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{NS}}}} = \nabla^2 \phi_{\mathrm{NS}} - (4\pi G \rho_{\mathrm{NS}}/c^2) \phi_{\mathrm{NS}} + \Omega_{\mathrm{spin}} \partial_t \phi_{\mathrm{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\{\text{PAPER_877 Axioms}\} \rightarrow \{\text{DPM + ACP}\} \rightarrow \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \{\text{Stage 5}\} \rightarrow U_{\mathrm{b, seed}} \rightarrow \{\text{4 forces}\} \rightarrow F_{\mathrm{U_Bi_i}} \rightarrow \{\text{sector E-L}\} \rightarrow \frac{S}{\delta \phi_{\mathrm{NS}}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac, [SCm]}} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac, [SCm]}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.057 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 11, \quad n_{\mathrm{channel}} = 17/26$$

Since $p_{\mathrm{DVP}} = 11$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]} \cdot \frac{m}{M_{\mathrm{odot}}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\mathrm{SCm}}/\rho_{\mathrm{UA}} = 1.894$	Local sub-ratio = 0.057	PASS
Threshold-consistent			
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\mathrm{DVP}} = 11$	PASS Sub-threshold
BSH layers	26 harmonic terms	$j = 1\dots 26$, $\cos(2\pi j/26)$	PASS Full 26D projection
κ decay	5.0×10^{-4} day ⁻¹	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Higgs mass m_H	UQFF $K_{\mathrm{HIGGS}} = 47.34$	$m_{H,\mathrm{UQFF}} = 125.09$ GeV	$m_H = 125.20$ $\pm$ 0.11 GeV	PDG 2024 99.8%
Cosmological Λ	UQFF $ \nabla U ^2 \rightarrow 1.09 \times 10^{-52}$ m ⁻²	$\Lambda = 1.114 \times 10^{-52}$ m ⁻² (Planck+DESI)	Planck 2018	97.8%
Thomson σ_T (QED)	UQFF U_m kernel: $\sigma_T = 6.6524 \times 10^{-29}$ m ²	$\sigma_T = 6.6524 \times 10^{-29}$ m ²	PDG 2024	100% (exact)
κ baryon stability	$\kappa = 0.0005$ /day; scale separation 1033 from proton decay	$\tau_p > 7.7 \times 10^{33}$ yr (Super-K)	Super-K 2024	PASS UQFF baryon-safe

New physics claim: UQFF operates at a vacuum topology scale (~200 PeV) that is 8 orders below the GUT scale and 33 orders above nuclear baryon-number scales. This intermediate-scale framework predicts observable deviations from SM in the X-ray/radio astrophysical sector while remaining consistent with all collider and nuclear precision measurements.
