Orion emergence fraction: **18.32%** | Mean size: **375.87 AU**

§4 — Proplyd $\leftrightarrow$ DPM Bidirectional Framework

Proplyds explain DPM:

Proplyds (proto-stellar disks undergoing photoevaporation) are physical realizations of the split monopole structure — the ionized outer disk corresponds to DPM_s (south/CCW) and the dense inner core to DPM_n (north/CW). The bipolar outflow is the observable signature of $\omega_{CW} - \omega_{CCW}$ differential rotation.

DPM explains Proplyds:

The magnetic braking catastrophe in classical star formation (angular momentum of infalling gas is too large) is resolved by the DPM_drive frequency gradient:

$$\dot{J}_{DPM} = -\frac{\partial(DPM_{drive} \cdot r^{26})}{\partial r} \cdot L$$

DPM extracts angular momentum via the 26th-order spatial gradient, naturally reducing J to observed proplyd rotation rates without requiring a singular disk/wind coupling.

§5 — Three UQFF Number Systems — New Contexts (PAPER_429)

System	PAPER_429 Definition	Session 141 New Context
Vacuum Density Series	$Li_{26}([SSq]) \approx 0.570$	Anchors ρ_{UA} in $Buoy_{grad}$; $Freq_{open}/r^{26}$ void displacement
Dipole Vortex Primes	$p > 26$, $p_{special} = 113$	$Spectra_{quant}$ prime vortex modes in DPM_{drive} ; non-repeating quantum egg fingerprints
Buoyancy Harmonics	$U_{g2} = \sum H_m(1 - e^{-[SSq] \cdot m}) \cos(\omega t_n)$	
$Resonance_{harm} \rightarrow Buoy_{grad}$ harmonic correspondence; same damping in US_{egg} integral		

§6 — Validation Summary

Paper	Test	Result
PAPER_521	$US_{range} > 0$	$\blacksquare$ 7.57×10^{21} Hz
PAPER_522	$DPM_{drive} > ReRing_{BB}$	$\blacksquare$ $\sim 10^{14}$ Hz
PAPER_523	Trapezoidal integral converges	$\blacksquare$ 1.008×10^{23} Hz $\cdot s$
PAPER_524	$f_{emerge} \approx 0.1832$	$\blacksquare$ 18.32%
PAPER_525	Hub status COMPLETE	$\blacksquare$

§7 — Testable Predictions

1. Radio surveys should detect a $\text{ReRing}_{\text{BB}}$ background echo at $f \sim \text{Freq}_{\text{max}} \cdot e^{-1}$ in the stable-mass regime.
2. Proplyd emergence fractions in non-Orion HII regions should converge to $\approx 18\%$ if the SSq calibration is universal.
3. The UQFF spectral tensor eigenvalue λ_{stable} should be measurable via proplyd polarimetry in the $1/3$ stable spectral band.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

- > Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and
- > PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda |\phi|^2 - v_{\text{SCm}}^2 |\phi|^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2}(\partial_\mu \phi_{\mathrm{NS}})(\partial^\mu \phi_{\mathrm{NS}}) - V(\phi_{\mathrm{NS}}) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{NS}}) = \frac{1}{2} m^2 \phi_{\mathrm{NS}}^2 + \frac{\lambda}{4!} \phi_{\mathrm{NS}}^4 + \kappa \cdot \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot \phi_{\mathrm{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{NS}}}} = \nabla^2 \phi_{\mathrm{NS}} - (4\pi G \rho_{\mathrm{NS}}/c^2) \phi_{\mathrm{NS}} + \Omega_{\mathrm{spin}} \partial_t \phi_{\mathrm{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \rightarrow \text{DPM + ACP} \rightarrow \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \text{Stage 5} \rightarrow U_{\mathrm{b,seed}} \rightarrow \text{4 forces} \rightarrow F_{U_{\mathrm{Bi}}} \rightarrow \text{sector E-L} \rightarrow \frac{\delta S}{\delta \phi_{\mathrm{NS}}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac},[\mathrm{SCm}]} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.112 (near-threshold regime), placing it in the π collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 53, \quad n_{\mathrm{channel}} = 6/26$$

Since $p_{\mathrm{DVP}} = 53$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

New physics claim: UQFF MUGE generates gravity enhancement factors ($g_{\text{total}}/g_{\text{Newt}} > 1$) for Solar System / Proplyd through vacuum buoyancy coupling — a mechanism absent from GR+SM. The enhancement factor and X-ray luminosity are linked via the UQFF buoyancy flux, providing a testable prediction for future HST/VLT monitoring observations.
